FOREWORD FROM THE COUNTY OF SANTA CLARA PLANNING OFFICE

Background

The purpose of this report is to determine the volumes of traffic entering and exiting the Stanford campus during the inbound AM commute peak hour and the outbound PM commute peak hour, respectively, and compare them to a traffic baseline. This comparison is performed on an annual basis in the spring and the fall of each year. The requirements for establishing the traffic baseline and performing annual comparisons to the baseline are contained in the December 2000 Stanford Community Plan, General Use Permit (GUP), and their Environmental Impact Report (EIR). These documents can be reviewed at the County of Santa Clara (County) website or at the County Planning Office. Essentially, Stanford is required to attain a No-Net-New-Commute-Trips standard, as defined in the 2000 GUP and EIR.

The Process

Following the adoption of the GUP by the County Board of Supervisors in December 2000, the County Planning Office selected AECOM to conduct the monitoring process outlined in the conditions of approval. Because of the type of data to be collected (particularly license plate numbers), the data could not be collected until after the start of daylight-saving time in the spring of 2001. The data collection involved three 2-week intervals in the spring and one 2-week interval in the fall of 2001, for a total of 8 weeks of count data.

Condition of Approval G.7. in the 2000 GUP outlines the process for establishing the baseline counts and for continuing monitoring in subsequent years. The approved process is summarized as follows:

- Weekday peak-hour traffic is counted at least three times per year for a 2-week interval each time. The established methodology dictates that 8 weeks of counts be averaged to show the annual traffic level.
- All counts are recorded at 16 campus entry and exit points, which form a cordon around the campus.
- License plate numbers are recorded for each vehicle entering and exiting; these data are used to determine the volume of non-campus traffic that crosses the cordon.
- Cordon volumes are adjusted to account for parking lots within the cordon used by hospital-affiliated vehicles (these volumes are subtracted from the cordon line counts) and parking lots outside the cordon used by University-affiliated vehicles (these volumes are added to the cordon line counts).
- Based on the cordon line counts, a peak hour is then established for the campus, adjusted for cut-through traffic and parking.

Condition of Approval G.6. in the 2000 GUP defines the peak commute directions as entering the campus in the morning peak commute hour and leaving the campus in the evening commute hour. The peak AM and PM commute hours are defined as the 1-hour intervals of time with the highest volume of traffic between 7 AM and 9 AM and between 4 PM and 6 PM, respectively, as defined by the counts. Therefore, the two peak hours are considered to be independent events. For example, an increase in AM peak traffic beyond the one percent trigger for two out of three years would trigger the additional elements of the monitoring program without a change, or even a decrease, in PM peak traffic. Also, an increase exceeding the baseline threshold during one year in the AM and an increase exceeding the baseline threshold in the PM for the following year would not trigger additional mitigation. Detailed information on the count results for each year from 2001 to the present is shown in the Summary and Comparison of Previous Reports section of this report.

1 INTRODUCTION

This report presents the annual traffic and parking data collected at Stanford University by AECOM during the 2024 monitoring interval. This is the second, and annual, report of the calendar year presenting both the spring and the fall data. The monitoring program methodology dictates that traffic volumes be collected for six weeks during the spring of each year and two weeks during the fall of each year. The data include vehicle counts at all access points to the campus and parking lots. Parking lot counts and cut-through percentages are used to adjust the raw traffic counts to determine the total amount of peak-hour traffic generated by Stanford University. The parking data provide information on the quantity of campus traffic that parked outside of the count area (added to the cordon counts) and hospital traffic parking inside the count area (subtracted from the cordon counts). License plate survey results were used to calculate the amount of traffic that cuts through the campus and is not considered University-generated traffic. The originally established data collection methodologies, and revisions made to them, are described in greater detail in Task 1 of this report. A description of the data analysis procedures is presented in Task 2 of this report.

Condition G.7.a. of the 2000 General Use Permit (GUP) requires that traffic counts be performed a minimum of three times per year, for an interval of two weeks each time. Since 2003, the established methodology for the traffic monitoring program is six weeks in the spring and two weeks in the fall, for a total of eight weeks of count data.¹

Task 1.0: Traffic Monitoring Data Collection Methodology

The collection of traffic data is foundational to the traffic monitoring program. This section describes each step of collecting that data.

Task 1.1: Machine Cordon Line Traffic Counts

Directional traffic counts are collected at Stanford University for eight weeks each calendar year on each of the 16 roadways that provide access to and from the campus. The locations of the 16 cordon counts are listed below and shown graphically in Figure 1 and Figure 2.

STANFORD UNIVERSITY TRAFFIC MONITORING REPORT

Figure 2
DAILY MACHINE CORDON COUNT LOCATIONS

The detailed traffic counts at the 16 cordon locations during the six weeks of counts conducted in 2024 are presented in Appendix A and are summarized in Table 1. Table 1 shows the AM inbound and PM outbound peak-hour volumes for each traffic-monitoring day. As indicated in Table 1, the AM peak hour in 2024 all occurred from 8:00 to 9:00, which is consistent with historical trends. The PM peak hour most frequently occurred from 5:00 to 6:00, which is also consistent with historical patterns.

Campus activity has largely returned to normal after the COVID-19 pandemic campus shut down which began in March 2020 and continued through the spring of 2021. However, it is likely that more commuters are still working from home, or being in the office for only a portion of the day, compared with before the pandemic. This is illustrated by traffic volumes remaining lower than pre-pandemic.

We compare the high and low days with each other. The unadjusted (raw) AM inbound traffic volumes ranged from a low of 3,086 on Friday, April 12, 2024; to a high of 3,974 on Tuesday April 30, 2024. The 2024 program found an average AM peak-hour traffic volume of 3,608, which is 88 percent of the pre-pandemic average (4,091) observed between 2001 and 2019. The unadjusted (raw) PM inbound traffic volumes for 2024 ranged from a low of 3,550 on Monday, April 8, 2024; to a high of 4,297 on Wednesday, May 15, 2024. The 2024 program found an average PM peak-hour traffic volume of 3,960, which is 91 percent of the average volume (4,355) for the 19 years before the pandemic.

Task 1.2: Parking Lot Driveway Counts

The number and location of the parking facilities on campus fluctuate from year to year due to ongoing construction and shifts in land uses campuswide. Off campus, where both university- and hospital-affiliated cars park and university-affiliated cars are accounted for and added to the monitoring total, the following parking facilities were shared between hospital and university parkers in 2024:

- L-1 – Rectangle Lot adjacent to PS-9
- L-1A – “n”-shaped lot around the medical plaza by Quarry Road and Palo Road
- Arboretum/Childcare -- on-street parking adjacent to L-1A
- L-2 – Quarry/Vineyard Lot adjacent to the Center for Academic Medicine (CAM) garage
- CAM – CAM garage (parking structure)
- L-3 – Lot off Quarry Road south of the CAM garage

Inside the cordon, where hospital cars are accounted for and subtracted from the total, the following parking facilities are in use:

- L-17 – near PS-5 with access from Stock Farm Road
- L-18 – near PS-5 with access from Oak Road
- L-20 – near PS-5 with access from Oak and Stock Farm Roads
- L-22 – Searsville parking lot
- Searsville Road – on street parking
- L-9J – next to the hospital, inside the cordon but accommodating only hospital cars
- PS-1 – Roth Way garage (parking structure)
- Museum lots and on-street parking near the museum
- Roth Way on-street parking – a parallel roadway to the museum lots
- PS-5 – Stock Farm garage (parking structure)
- Oak and Welch on-street parking – along the roadway adjacent to L-17 and L-18

Where possible, both tube counts and parking permit scanning by truck have been used at these locations to determine the peak-hour volumes and the proportions of those volumes that are campus or hospital traffic. Appendix B includes the detailed tube count sheets for the driveway traffic at these facilities. The truck scans data are shown in Appendix F. The driveway count locations are presented in Figure 3.

Task 1.3: Parking Permit Scanning/Count

This task determines which cars in the parking facilities are affiliated with the University and which are affiliated with Stanford Hospital. Whenever the affiliation of a vehicle is not obvious, the vehicle is assumed to be parked in its designated area; that is, vehicles parked inside the cordon are assumed to be campus-affiliated, and vehicles parked outside the cordon are assumed to be hospital-affiliated. This approach has been accepted and approved by the County since the inception of this methodology. The data is collected four times per day: at 7 AM, 8:30 AM, 4 PM and 5:30 PM. This step involves two data sources: 1) the percentage of Hospital or University affiliated vehicles, and 2) the total cars entering that facility during the peak AM and PM peak hours.

For the percentage of Hospital and University affiliated vehicles, this scan was originally done manually, with staff tabulating the Stanford-provided multicolored windshield stickers for each parking facility, how many vehicles had hospital stickers, how many had university stickers, and how many had unrecognizable or no stickers, based on the color and type of sticker shown. In 2018, Stanford changed their parking permit system to be based on license plate registration rather than the multicolored stickers. It was therefore necessary to engage Stanford staff, with monitoring program staff observing to provide proper monitoring oversight, to scan the license plates using trucks with computers and video scanners. A detailed memo on this process was included as an appendix to the 2022 annual report. The current system may use fewer staff hours, but staffing requires Stanford's involvement. The purpose of the monitoring program is for the County to make sure Stanford does not exceed its traffic limits; thus Stanford should not be directly involved in the monitoring program to ensure the impartiality of the evaluation. Program staff must observe Stanford staff as they engage in these efforts, and monitoring program staff must be "supervisor" level or above.

Tube counts were not available or possible at some locations, including the museum lots; on-street parking along Searsville Road; Oak Road, between Stock Farm Road and Welch Road; and Welch Road, between Campus Drive West and the cordon station just north of Oak Road. Specifically, it is not possible for tube counts to distinguish between parked cars and cars just driving on the roadway near on-street parking. For this reason, the monitoring program instead uses the tabulations from the permit scanning four times per day to determine the total number of parked cars for this adjustment. The raw numbers from each scan are compared with each other (7 AM is compared with 8:30 AM to determine the number of cars by affiliation parking during the AM peak hour; and 4 PM is compared with 5:30 PM to determine the number of cars by affiliation parking during the PM peak hour). Appendix F displays these numbers.

Task 1.4: License Plate Survey

The purpose of the license plate survey is to identify vehicles that are only passing through the Stanford campus and not beginning or ending their trip on campus. License plate numbers are recorded for vehicles entering and leaving each cordon location. Vehicles that enter the cordon and leave through any gateway (other than the same one where they entered) within an interval of 20 minutes are considered to be "cut-through" vehicles. Surveys are performed one day each week for the AM and PM commute times. The 2024 license plate matching process showed that the average AM and PM cut-through percentages were 14.3 percent and 16.8 percent, respectively. These average percentages are used to adjust their respective vehicle counts.

Given the increased prevalence of travel using a Transportation Network Company such as Uber or Lyft, since they came into existence, this methodology was examined to determine if it should be modified to better reflect current transportation and commute patterns. These vehicles may not be in fact "cutting through" and instead they could be dropping off passengers (thus, adding cars to the road to accommodate Stanford campus commuters). Appendix E displays the raw data. AECOM conducted an analysis, including recommendations for going forward; this was included as an appendix in the 2021 report, and the program conducted a follow up analysis in 2023 which is currently under review and should be included as a future Appendix to the annual report after it has been approved by the County.

Task 2.0: Traffic Monitoring Data Analysis

Task 2.1: Daily Cordon Count Spreadsheets

The first step of the data analysis task is to enter the raw cordon count numbers into spreadsheets. Two spreadsheets—one for the inbound AM peak hours and one for the outbound PM peak hours—are created for each weekday that a cordon count was conducted. Each spreadsheet shows the hourly AM inbound and PM outbound vehicles passing all 16 cordon locations during five sets of four 15-minute increments. For the AM peak, the hours are 7:00 to 8:00, 7:15 to 8:15, 7:30 to 8:30, 7:45 to 8:45, and 8:00 to 9:00. For the PM peak, the hours are 4:00 to 5:00, 4:15 to 5:15, 4:30 to 5:30, 4:45 to 5:45, and 5:00 to 6:00. The cordon counts are collected for 6 weeks in the spring and two weeks in the fall. The spring report includes 60 daily cordon count spreadsheets (30 AM and 30 PM), and the annual report includes 80 daily cordon count spreadsheets (40 AM and 40 PM, including the spring data). Appendix C presents these spreadsheets.

Task 2.2: Daily Parking Spreadsheets

The number of vehicles entering and exiting the parking lots and garages in the vicinity of Stanford Medical Center, shared between hospital and university uses, are monitored during the 6-week period in the spring and the 2-week period in the fall. The AM inbound and PM outbound volumes at all lot entrances are entered into spreadsheets for the AM and PM peak hours of each day, as described for the cordon counts in Task 2.1. All daily parking spreadsheets are included in Appendix D.

Task 2.3: Adjustments for Parking and Cut-Through Vehicles

AECOM used the parking counts described in Task 1.2 and Task 1.3 to adjust the raw traffic counts. The parking permit ratios of hospital or campus vehicles are applied to the parking lot AM inbound and PM outbound volumes to adjust the cordon count spreadsheets. Because Lot 1, Lot 1A and the Arboretum/Childcare area, Lot 2, Lot 3, and CAM garage are outside of the cordon boundary, campus-affiliated vehicles parking in these lots are not captured in the cordon count. To add these vehicles to the cordon count, the average percentage of campus-affiliated vehicles in each of these lots is multiplied by the traffic volume (either AM inbound or PM outbound, depending on the peak interval) at each lot entrance (from Task 2.2), and the results are then added to the cordon counts.

Note that the cordon boundary is different than the property boundary for logistical reasons related to placement of the count tubes. As a result, Lot 3, Lot 2, and portions of Lot 1—which are on the Stanford Academic Campus—are actually outside of the cordon.

The approach is reversed for the parking facilities inside the cordon. Lot 17; Lot 18; Lot 20; Lot 9J; the museum lots; on-street parking in the museum area; on-street parking along Oak, Welch, and Roth; PS-1 (Roth Way garage); and PS-5 (Stock Farm garage) are inside the cordon. The monitoring program subtracts hospital-affiliated vehicles parking inside the cordon from the total traffic counts. The percentage of hospital-affiliated vehicles in each lot is determined either by applying the scanned percentage (including campus, hospital, and no-known-affiliation vehicles) to the traffic flows or, alternately, using the raw scanned totals based on the difference between the first scan (at 7 AM or 4 PM) and the second scan (at 8:30 AM or 5:30 PM, respectively).

Table 2 displays a total cordon counts, adjusted for parking lot factors and cut-through traffic, with the average AM inbound and PM outbound traffic volumes and the peak-hour time intervals. Table 3 shows the traffic data collected in the 2001 baseline Stanford Traffic Monitoring Program, including the baseline average and the 90 percent confidence interval.

2 INBOUND AM TRAFFIC

The 2001 baseline counts determined that an average of 3,439, or more, inbound automobile trips during the AM peak hour would constitute a significant increase in traffic at the 90 percent confidence level of the 2001 baseline counts (3,319 automobile trips).

The 2024 results are compared to the 2001 baseline in Figure 3. The 2024 AM inbound adjusted average is 2,779 vehicles, 84 percent of the adjusted baseline from 2001. Figure 3 graphically displays the 2024 AM inbound adjusted data and compares the daily fluctuations with the 8-week average. The y-axis (vertical) is the number of trips, and the x-axis (horizontal) is the count day when the AECOM team counted the number of cars.

Figure 3 2024 AM Peak-Hour Adjusted Traffic Counts

3 OUTBOUND PM TRAFFIC

The 2001 baseline counts determined that an average of 3,555 or more outbound vehicles during the PM peak hour would constitute a significant increase in traffic at the 90 percent confidence level of the 2001 baseline count of 3,446 vehicles.

The 2024 results are compared to the 2001 baseline in Figure 4. The 2024 PM inbound adjusted average is 3,019 vehicles, 88 percent of the adjusted baseline from 2001. Figure 4 graphically displays the 2024 PM inbound adjusted data and compares the daily fluctuations with the 8-week average. The y-axis is the number of trips, and the x-axis is the count day when the AECOM team counted the number of cars.

4 CONCLUSION

The 2024 average AM inbound count of 2,779 vehicles is 540 vehicles below the baseline 2001 AM inbound count; 660 vehicles lower than the upper boundary of the 90 percent confidence interval; and 695 vehicles lower than the established one percent trigger. The established one percent increase trigger requirement is not met for the AM peak hour; Stanford has complied with the No-Net-New-Commute-Trips requirements in 2024.

The 2024 PM outbound count of 3,019 vehicles is 427 vehicles below the baseline 2001 PM outbound count; 536 vehicles lower than the upper boundary of the 90 percent confidence interval; and 572 vehicles lower than the established one percent trigger. The established one percent increase trigger requirement is not met for the PM peak hour; Stanford has complied with the No-Net-New-Commute-Trips requirements in 2024.

5 SUMMARY AND COMPARISON OF PREVIOUS REPORTS

The purpose of the Stanford University No-Net-New-Commute-Trips Compliance Monitoring Program is to compare the volume of traffic entering and exiting the Stanford Campus during the weekday inbound AM peak and the outbound PM peak, respectively, to a traffic baseline. This comparison is performed on an annual basis. The requirements for establishing the traffic baseline and performing annual comparisons to the baseline are contained in the December 2000 Stanford Community Plan, GUP, and its Environmental Impact Report (EIR). Stanford University is required to attain a No-Net-New-Commute-Trips standard, as defined in the 2000 GUP and EIR.

Condition of Approval G.7. in the 2000 GUP outlines the process for establishing the baseline counts and for continuing monitoring in subsequent years. The approved process is summarized as follows:

- Weekday peak-hour traffic is counted at least three times per year for a 2-week interval each time. The established methodology dictates that 8 weeks of counts are averaged to show the annual traffic level.
- All counts are recorded at 16 campus entry and exit points, which form a cordon around the campus.
- License plate numbers are recorded for each vehicle entering and exiting to determine the volume of cut-through traffic.
- Cordon volumes are adjusted to account for parking facilities within the cordon used by the hospital (these volumes are subtracted from the cordon line counts) and parking facilities outside the cordon used by the University (these volumes are added to the cordon line counts).²
- A peak hour is then established for the campus based on the cordon line counts, adjusted for cut-through traffic and parking.

Condition of Approval G.6 in the 2000 GUP defines the peak commute directions as entering the campus in the morning peak commute hour and leaving the campus in the evening commute hour. The peak AM and PM commute hours are defined as the 1-hour intervals with the highest volume of traffic between 7 AM and 9 AM and between 4 PM and 6 PM, respectively, as defined by the counts. Therefore, the two peak hours are considered to be independent events. For example, an increase in AM peak traffic beyond the 1 percent trigger for 2 out of 3 years would trigger the additional elements of the monitoring program without an increase in the PM peak traffic during those same years. Likewise, a significant increase during a single year in the AM and a significant increase in the PM for the following year would not trigger additional mitigation. Detailed information on the count results for each year from 2001 to the present is included later in this section of the report.

These data collection efforts have taken place for more than two decades, creating the opportunity to look for trends over time. Only raw traffic counts were collected in 2020 and spring 2021 due to the COVID-19 pandemic shelter in place order; for this reason, Figure 6 displays the total raw, unadjusted traffic counts for the AM and PM peak hours from 2001 through 2024 for comparison. Figure 7 displays the historical trends in the adjusted data (except for 2020, when data were not collected). The baseline and thresholds are based on adjusted data.

² This methodology changed during 2018. These data were only available in the spring of 2018. In the fall of 2018, because Stanford's contractor did not deliver the needed data for this portion of the calculation, AECOM instead used fall 2017 data as a placeholder. In the spring of 2019, 2017 data were again used because Stanford collected the data itself and it is inappropriate for Stanford to monitor its own traffic for compliance with the GUP. In the fall of 2019, however, AECOM and Stanford worked together to collect and summarize the required data. A memorandum released with the 2019 annual report provided a summary, discussion, and recommendations for how this process should be conducted in the future, based on our observations from fall 2019.

Figure 6 Peak-Hour (AM and PM) Traffic Volume Trends (Raw Traffic Data) 2001 - 2024

Figure 7 Peak-Hour (AM and PM) Traffic Volume Trends (Adjusted Traffic Data) 2001 - 2024

Traffic in 2024 was roughly the same as 2023 after some rebound from pandemic patterns prior in between 2021 and 2023. It has returned to about 90% of the prior-years' average, from the lull it experienced post COVID-19 pandemic which yielded 43-47% of traffic levels pre-pandemic. This pattern is also reflected in the media, with SF Gate reporting lower traffic in the San Francisco Bay Area compared with other major metro areas post-pandemic.³ Increased prevalence of working from home may be the way Bay Area, and also Stanford, workers live now, reflected in the continuation of lower traffic rates compared with pre-pandemic.

The following is a summary of the baseline report prepared in 2001, and of the 21 years of monitoring from 2002 through 2024.

5.1 Traffic Baseline Report

The Traffic Baseline Report represents the first year of traffic monitoring. This report established the baseline conditions to which subsequent years are compared.

5.1.1 Stanford University No-Net-New-Commute-Trips Compliance Monitoring Program Report – 2001 GUP Baseline

The 2001 Baseline Report was originally issued on July 3, 2002. An update to that report was issued on October 15, 2003. In accordance with the provisions of the GUP, this original Traffic Baseline Report established the standard for measuring future traffic impacts to the No-Net-New-Commute-Trips standard. No conclusions were drawn from this report.

The following were the count dates of the 2001 Baseline Report:

- Week of April 2, 2001
- Week of April 9, 2001
- Week of April 23, 2001
- Week of April 30, 2001
- Week of May 7, 2001
- Week of May 14, 2001
- Week of October 22, 2001
- Week of October 29, 2001

The following were the results of the 2001 Baseline Monitoring:

Inbound AM:

Average count	3,319
90 percent confidence interval	± 120
Significant traffic increase	3,439
1 percent increase trigger	3,474

Outbound PM:

Average	3,446
90 percent confidence interval	± 109
Significant traffic increase	3,555
1 percent increase trigger	3,591

5.1.2 Stanford University No-Net-New-Commute-Trips Compliance Monitoring Program Report – 2002 Monitoring Report #1

The 2002 Monitoring Report was originally issued in July 2003. The count dates for the 2002 Monitoring Report were as follows:

- Week of April 15, 2002
- Week of April 22, 2002
- Week of April 29, 2002
- Week of May 6, 2002
- Week of May 13, 2002
- Week of May 20, 2002
- Week of October 14, 2002
- Week of October 21, 2002

The 2002 Monitoring Report concluded that the adjusted AM inbound count totaled 3,390 vehicles. This represents an increase of 71 vehicles, which fell within the 90 percent confidence interval and did not represent a significant AM inbound traffic increase. The PM outbound count totaled 3,678 vehicles, which was an increase of 232 vehicles from the baseline and was higher than the 90 percent confidence interval. This count exceeded the one percent trigger of 3,591 vehicles by 87. The following is a summary of the results of the 2002 Monitoring Report, contained in the July 2003 document.

Inbound AM:

Adjusted average 2002 count	3,390
Baseline-established 90 percent confidence interval (2001)	± 120
Baseline-established significant traffic increase (2001)	3,439
Baseline-established 1 percent increase trigger (2001)	3,474
Result (falls below the 1 percent trigger by 84)	-84

Outbound PM:

Adjusted average 2002 count	3,678
Baseline-established 90 percent confidence interval (2001)	± 109
Baseline-established significant traffic increase (2001)	3,555
Baseline-established 1 percent increase trigger (2001)	3,591
Result (232 increase in vehicles exceeds the trigger by 87 vehicles)	+87

5.1.2.1 Adjustment 1 to 2002 Monitoring Report

An update to the original 2002 Monitoring Report was issued on October 15, 2003. Following the publication of the July 2003 report, Stanford and the County separately analyzed traffic data for the Stanford Homecoming Week. Based on consultation with Stanford and independent analysis of County consultant traffic data, the County determined that data collected for the week of Homecoming should not be included in the comparison data set. The rationale for this decision was that this event (Homecoming) had been ongoing for years, was not included in the baseline count, and would continue to be an annual event. The County communicated to Stanford that other future “large events” would not be excluded from future counts. The revised report substituted the week of October 28, 2002, for the previously counted week of October 14, 2002. The following are the results of the Revised 2002 Monitoring Report.

Inbound AM:

Adjusted average 2002 count	3,287
Baseline-established 90 percent confidence interval (2001)	± 120
Baseline-established significant traffic increase (2001)	3,439
Baseline-established 1 percent increase trigger (2001)	3,474

Result (falls below the 1 percent trigger by 187) -187

Outbound PM:

Adjusted average 2002 count	3,598
Baseline-established 90 percent confidence interval (2001)	± 109
Baseline-established significant traffic increase (2001)	3,555
Baseline-established 1 percent increase trigger (2001)	3,591
Result (152 increase in vehicles exceeds the trigger by seven vehicles)	+7

5.1.2.2 Adjustment 2 to the 2002 Monitoring Report

Subsequent to the first adjustment to the 2002 Monitoring Report, Stanford informed the County that additional Marguerite shuttle runs had been introduced to campus since the completion of the baseline count and thus were counted in the Year 1 (2002) comparison counts. This addition resulted in an increase of 12 vehicles in each peak hour. County staff determined that these new bus lines should be subtracted from the comparison count. This determination led to the following end result:

Inbound AM:

Adjusted average 2002 count	3,275
Baseline-established 90 percent confidence interval (2001)	± 120
Baseline-established significant traffic increase (2001)	3,439
Baseline-established 1 percent increase trigger (2001)	3,474
Result (falls below the 1 percent trigger by 199)	-199

Outbound PM:

Adjusted average 2002 count	3,586
Baseline-established 90 percent confidence interval (2001)	± 109
Baseline-established significant traffic increase (2001)	3,555
Baseline-established 1 percent increase trigger (2001)	3,591
Result (falls below the 1 percent trigger by five vehicles)	-5

The AM inbound adjusted average shows a decrease of 44 vehicles from the baseline; this decrease falls within the 90 percent confidence interval of ± 120. Because the established one percent increase trigger requirement is not met, no additional mitigation is required.

The PM outbound adjusted average shows an increase of 140 vehicles from the baseline count. This increase falls above the +90 percent confidence interval by 31 vehicles, but falls below the one percent increase trigger by five vehicles. Because the established one percent increased trigger requirement is not met, no additional mitigation is required. The 2002 volumes compared to 2001 baseline volumes do not constitute a statistically significant increase in either the AM or the PM peak hours and no mitigation measure is required.

The 2000 Stanford GUP Condition G.8. specifies that the County will recognize and “credit” Stanford’s off-campus trip reduction efforts within defined geographic boundaries. These credits will be applied to Stanford’s attainment of the No-Net-New-Commute-Trips standard. In 2003, Stanford and the County discussed potential methodologies for providing credits to Stanford. The County developed draft guidelines, which were reviewed by the Community Resource Group. The Planning Office approved the final guidelines on October 9, 2003. These guidelines are presented in the “Stanford Traffic Cordon Count Credit Guidelines,” dated October 28, 2003.

On April 24, 2006, Stanford submitted a 2005 trip credit report that was reviewed by AECOM. This report documented a credit of 174 trips for the increase in the number of bus trips across the cordon points and the number of transit passengers served outside the cordon area in the PM peak hour between the 2001 baseline and 2005. Using the new Marguerite shuttle Automated Transportation Management System, the number of passengers getting on and off the shuttle at each stop was counted. Most of the trip credits claimed are for passengers (primarily Stanford Hospital employees) getting on the shuttle outside the cordon area and traveling to the Palo Alto Caltrain station. As outlined in the adopted guidelines, full credits are claimed for trips in the peak commute direction, and one-third credits are claimed for trips in the reverse direction. Pass-through credits are claimed for those passengers

who board outside the cordon, pass through the campus, and then alight outside the campus, based on onboard surveys. As summarized below, with the trip credit of 174 trips, Stanford did not exceed the no net new commute trip standard, based on the 2005 monitoring program.

Outbound PM:

Adjusted average 2005 count	3,735
Baseline-established 90 percent confidence interval (2001)	± 109

Count information for the week of October 29, 2012 (Week 8) was not used due to irregular traffic volumes caused by the construction on Junipero Serra Boulevard. As noted earlier, monitoring is only required for a minimum of 6 weeks per year. Therefore, the data collection for 2012 meets the requirements of Condition of Approval G.7.

The 2000 Stanford GUP Condition G.8. specifies that the County will recognize and “credit” Stanford’s off-campus trip reduction efforts within defined geographic boundaries. These credits will be applied to Stanford’s attainment of the No-Net-New-Commute-Trips standard. In 2003, Stanford and the County discussed potential methodologies for providing credits to Stanford. The County developed draft guidelines, which were reviewed by the Community Resource Group. The Planning Office approved the final guidelines on October 9, 2003. These guidelines are presented in the “Stanford Traffic Cordon Count Credit Guidelines,” dated October 28, 2003.

On January 22, 2013, Stanford submitted a 2012 trip credit report that was reviewed by AECOM. This report documented a credit of 301 trips for the increase in the number of bus trips across the cordon points and the number

of transit passengers served outside the cordon area in the PM peak hour between the 2001 baseline and 2012. As outlined in the adopted guidelines, full credits are claimed for trips in the peak commute direction and 1/3 credit claimed for trips in the reverse direction. The following is a summary of the 2012 Outbound PM results with the trip credit of 301 trips.

Outbound PM:

Adjusted average 2012 count	3,590
2001 baseline	3,446

On January 31, 2014, Stanford submitted a 2013 trip credit report that was reviewed by AECOM. This report documented a credit of 339 trips for the increase in the number of bus trips across the cordon points and the number of transit passengers served outside the cordon area in the PM peak hour between the 2001 baseline and 2013. - Week of October 6, 2014 (October 10, 2014 data not used)

The 2014 Monitoring Report concluded that the adjusted AM inbound count totaled 3,336 vehicles. This represents an increase of 17 vehicles from baseline; it is 103 vehicles below the 90 percent confidence interval and 138 vehicles below the 1 percent established trigger. The PM outbound count totaled 3,696 vehicles, which is an increase of 250 vehicles from the baseline and is above the 90 percent confidence interval by 141 vehicles and above the 1 percent increase trigger by 105 vehicles. Count information for Friday, October 10, 2014 (Week 8) was not used because of irregular traffic volumes likely attributable to the Palo Alto Unified School District not being in session due to a staff development day and to a Stanford home football game. As noted earlier, monitoring is required for a minimum of 6 weeks per year. Therefore, the data collection for 2014 meets the requirements of Condition of Approval G.7.

The 2018 average AM inbound count of 3,575 vehicles is 256 vehicles higher than the baseline 2001 AM inbound count; 136 vehicles above than the upper boundary of the 90 percent confidence interval; and 101 vehicles above the established 1 percent trigger. Because the AM peak-hour traffic is above the trigger, Stanford Trip Credits are applied to the total to bring the number into compliance with the metric. The post-audit 2018 Trip Credits total is 595 Trip Credits.

The 2018 PM outbound count of 3,509 vehicles is 63 vehicles higher than the baseline 2001 PM outbound count; 46 vehicles lower than the upper boundary of the 90 percent confidence interval; and 82 vehicles lower than the established 1 percent trigger. The established 1 percent increase trigger requirement is not met; as a result, no mitigation is required.

5.1.20 Stanford University No-Net-New-Commute-Trips Compliance Monitoring Program Report – 2020 Monitoring Report #20

This section summarizes the 2020 Monitoring Report. The count dates for the 2020 Monitoring Report were as follows:

- Week of September 28, 2020
- Week of October 5, 2020

This year was highly unusual due to the 2020 COVID-19 shelter-in-place order, which was issued in March of 2020 and continued through the year. This resulted in the Stanford campus shutting down to limit the spread of the virus. The Stanford traffic monitoring program could not be conducted in the spring of 2020 because the campus was closed. In addition, the 2-week fall 2020 count included raw traffic volumes only. The methodology established for the 2000 GUP over the past 19 years requires traffic counts eight weeks per year. However, given the pandemic, the County determined that 2 weeks of raw traffic counts would be sufficient as long as the counts demonstrate reduced traffic volumes, due to the campus closures and the pandemic, when compared with the average raw counts from the previous 19 years.

As described in the previous paragraph, the data could not be compared with the baseline. Instead, AECOM compared the raw, unadjusted data with the newly compiled historic raw, unadjusted data from the previous 19 years. Two weeks of data in the fall of 2020 found an average AM peak-hour traffic volume of 1,747. This is compared with the AM peak-hour average of 4,091 from the previous 19 years of data. Two weeks of data in the fall of 2020 found an average PM peak-hour traffic volume of 2,045. This is compared with the PM peak-hour average of 4,355 from the previous 19 years of data. Thus, 2020 traffic counts during pandemic conditions showed traffic at less than half of normal levels.

5.1.21 Stanford University No-Net-New-Commute-Trips Compliance Monitoring Program Report – 2021 Monitoring Report #21

This section summarizes the 2021 Monitoring Report. The count dates for the 2021 Monitoring Report were as follows:

- Week of April 19, 2021
- Week of September 27, 2021
- Week of October 11, 2021
- Week of October 25, 2021
- Week of April 26, 2021
- Week of October 4, 2021
- Week of October 18, 2021
- Week of November 1, 2021

This year continued the highly usual conditions which began in 2020 with the COVID-19 shelter-in-place order which began in March of 2020. The Stanford campus was closed to limit the spread of the virus. The Stanford traffic monitoring program was conducted in the spring with the raw counts only. The campus reopened in the fall of 2021 with strict safety precautions in place when the counts were conducted as usual except for six weeks instead of two, to make up for the missed data in the spring. The methodology established for the 2000 GUP over the previous 19 years requires traffic counts eight weeks per year. However, given the pandemic, the County determined that 6 weeks of adjusted traffic data in the fall with two weeks of raw traffic data in the spring would be sufficient as long as the counts demonstrate traffic volumes are below the thresholds.

As described in the previous paragraph, 2021 represented a “hybrid” year in the monitoring program. In the spring, only raw counts were collected for two weeks, similar to how the program was executed in 2020, due to the COVID-19 pandemic and associated closure of the campus. In the fall, the data collection returned to normal, but for six weeks instead of the fall’s usual two weeks, to make up for the missed data from the spring. The spring 2021 report contains a full discussion of the raw, unadjusted spring data. Two weeks of data in the spring of 2021 found an average AM peak-hour traffic volume of 2,280. This is compared with the AM peak-hour average of 4,091 from the 19 years of data when there was not a public health crisis. Two weeks of data in the spring of 2021 found an average PM peak-hour traffic volume of 2,584. This is compared with the PM peak-hour average of 4,355 from the 19 years of data collected under normal conditions. Thus, spring 2021 traffic counts during pandemic conditions showed traffic at slightly more than half of normal levels. In the fall, the monitoring program collected all the data required to compare traffic levels to the baseline.

The 2021 Monitoring Report concludes that the adjusted AM inbound fall count totaled 2,719 vehicles. This represents a decrease of 600 vehicles from the baseline; it is 720 vehicles below the 90 percent confidence interval and 755 vehicles below the established 1 percent trigger. The PM outbound fall count totaled 2,892 vehicles, which is a decrease of 554 vehicles from the baseline; it is below the 90 percent confidence interval by 663 vehicles and below the established 1 percent trigger by 699 vehicles.
