memorandum

date	April 24, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Chris Sanchez, Brian Schuster - ESA
subject	**ESA Peer Review of Air Quality Technical Analysis for Housing Alternatives**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Air Quality Technical Analysis for Housing Alternatives*, dated April 6, 2018, prepared by Ramboll for Stanford.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated its memo accordingly. The memo was revised by Stanford on April 24, 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Air Quality Technical Analysis for Housing Alternatives* memo is appropriate for use as reference in the EIR.

MEMO

Client	**Stanford University**
Date	**April 24, 2018**

1. Introduction

The County of Santa Clara (the "County") has chosen to study two alternatives in response to comments on the 2018 Stanford General Use Permit (GUP) Draft EIR (DEIR). This memorandum summarizes the air quality technical analyses for these alternatives.

2. Description of Alternatives

The County has chosen to study two alternatives in response to housing comments on the DEIR. These alternatives are:

- *Full Offset Housing Alternative (Alternative FO):* Adds to the proposed project **2,549** additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of **5,699** net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- *Half Offset Housing Alternative (Alternative HO):* Adds to the proposed project **1,275** additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of **4,425** net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

2.1 Emissions Inventory Years

This report evaluates the criteria air pollutant (CAP) and toxic air contaminant (TAC) emissions inventories associated with the buildings and energy sources for the development proposed under Alternative FO and Alternative HO for the 2018 GUP. Inventories of existing conditions can be found in DEIR Appendix AQT Sections 3 and 4. Inventories presented here represent emissions for the completion of the development proposed for Alternative FO and Alternative HO, anticipated to occur by 2035.

This memo evaluates the emissions inventories for complete buildout of Alternative FO and Alternative HO. Complete buildout is called "Fall

2035" because it consists of the full operations of each of the Alternatives. However, the mobile source emissions are conservatively calculated using 2030 emission factors.[1] If 2035 mobile source emission factors were used instead of 2030, the total CAP and TAC emissions would be lower than reported here. Therefore, this comparison is a conservative estimate of the anticipated 2035 Alternatives emissions and is consistent with the methodology used in the DEIR.

Study area boundaries for the two Alternatives are the same as for the Project. Details regarding the boundaries can be found in DEIR Appendix AQT Section 1.2.1.

2.2 Air Quality Environmental and Regulatory Overview

Air quality existing conditions and regulatory overview remain unchanged since the publishing of the DEIR. Information on environmental and regulatory conditions can be found in DEIR Appendix AQT Section 2.

3. Criteria Pollutant Emissions Inventory

This section describes the methodology that Ramboll used to develop the Alternatives criteria air pollutant emission inventories, which include both construction and operational emissions. Sub-categories of criteria air pollutant operational emissions include: natural gas combustion, mobile sources, emergency generators, laboratories, and the fuel stations. Full details on the calculation methodology for the existing conditions and Project inventories are provided in DEIR Appendix AQT Appendix A.

3.1 Existing Conditions Inventories

The DEIR presented three scenario years to evaluate existing conditions: 2014, 2015, and Fall 2018. Existing conditions inventories and methodologies remain unchanged from the DEIR, with the exception of a correction for entrained roadway dust described in section 3.4.2 below. Further detail on these inventories can be found in DEIR Appendix AQT Sections 3 and 4.

3.2 Alternatives Inventories

This memo evaluates the emissions inventory for complete buildout of Alternative FO and Alternative HO. The Fall 2018 emissions inventory was used to develop each Alternative inventory by incorporating assumptions on growth in certain categories, such as an increase in number of residential beds. These scenarios consist of the full operations of each Alternative, which are anticipated to occur in 2035. **Table 3-1** summarizes Alternative FO and Alternative HO inventories. The 2018 Existing Conditions and Project inventories are also shown for comparison.

3.3 Construction Emissions – Alternatives

This section describes the estimation of CAP from construction activities within the study area. Average annual construction and demolition square footage from fiscal year 2001 through fiscal year 2015 were used to estimate the annual emissions from construction and demolition for all existing conditions and Project inventory years. Detailed information on the construction emissions calculations and methodologies are provided in DEIR Appendix AQT Section 3.3, and detailed emission inventory from the California Emissions Estimator Model (CalEEMod®) output files are included in DEIR Appendix AQT Appendix B.

[1] 2030 mobile source emission factors are used to be consistent in comparison with the 2030 GHG emissions threshold.

To evaluate construction emissions for Alternative FO and Alternative HO, emissions from the off-road equipment for additional proposed housing were estimated using CalEEMod® version 2013.2.2, while emissions for on-road vehicles were calculated using the same methodology as the DEIR as described in Section 3.4.2.[2] The number of additional units added to the proposed project under each Alternative was input into CalEEMod® divided by the average number of dwelling units constructed per year in order to calculate average annual emissions. The average number of dwelling units per year is based on the total number of additional units and the number of years until full buildout.

Estimates of the amount of excavation and demolition for the additional proposed housing units under both Alternatives were made based on scaling factors derived from the construction of the Escondido Village Graduate Residences (EVGR). Assuming future housing will be constructed with similar density and space needs, both excavation and demolition quantities for the Alternatives were calculated based on the average annual number of proposed dwelling units, assuming the same ratio of excavation and demolition per dwelling unit as EVGR. Alternative FO assumes construction of an annual average of 135 dwelling units, demolition of 3,539 square feet (sq ft) of buildings per year, and excavation of 82,821 cubic yards (CY) of soil. Alternative HO assumes construction of an annual average of 67 dwelling units, demolition of 1,167 sq ft of buildings per year, and excavation of 41,428 CY of soil.[3] CalEEMod® output files for the off-road equipment associated with the additional construction for the Alternatives are included as **Appendix A**. Additional on-road construction vehicle emissions are shown in Table 3-6**,** following the operational on-road vehicle emission tables**.**

The resulting annual emissions from CalEEMod® for each Alternative were added to the Project annual construction emissions to evaluate impacts. Consistent with the DEIR, all construction equipment is assumed to meet Final Tier 4 standards, except for chainsaws and paving phase equipment. Emissions for each Alternative are shown in **Table 3-1** and detailed mobile source tables 3-4 and 3-5 (described further in Section 3.4.2).

3.4 Operational Emissions – Alternatives

Existing conditions inventories (2014, 2015, and Fall 2018) remain unchanged from the DEIR with the exception of a correction for entrained roadway dust described in section 3.4.2 below. Further detail on these inventories can be found in DEIR Appendix AQT Section 3.4. This section describes methodologies for calculating the Fall 2035 inventories for Alternative FO and Alternative HO.

3.4.1 Natural Gas

The Alternatives inventories are based on the Fall 2018 inventory, scaled up for the development of the proposed 2018 GUP by 2035 and with the addition of the new Escondido Village Graduate Residences and additional housing units for each Alternative described in Section 1.1. Additional natural gas usage from the Alternatives housing is grouped in the "PGE Residential" and "PGE New Faculty/Staff Housing" subcategories. The additional graduate student natural gas use is scaled up by number of new beds, consistent with the DEIR

[2] Two more recent versions of CalEEMod® have now been released (versions 2016.3.1 and 2016.3.2). However, version 2013.2.2 was used to be consistent with the DEIR analyses.

[3] Construction and excavation quantities for the HO Alternative are not exactly half of those for the FO Alternative because the total number of dwelling units was rounded rather than using 0.5 dwelling units. Additionally, demolition was based on the number of potential dwelling units in the East Campus Development District (543 units in the FO Alternative and 179 units in the HO Alternative), as dwelling units constructed in other locations may not require demolition.

methodology. New private faculty/staff housing natural gas usage is based on averages for the climate zone assuming compliance with the 2016 Title 24 Building Energy Efficiency Standards, consistent with the usage assumptions for the proposed Project housing in the DEIR. Natural gas consumption, emission factors, and emissions for Alternative FO are summarized in **Table 3-2** and for Alternative HO in **Table 3-3**.

3.4.2 Mobile Sources

Methodologies for estimating CAP emissions from mobile sources remains unchanged from the DEIR. Increased housing from the two proposed Alternatives cause changes in mobile activity data. Updated activity data for Fall 2035 Alternatives (number of trips and/or VMT) for off-campus trips, on-campus trips, and construction trucks were provided by Fehr & Peers. Data from Fehr & Peers is provided in **Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis**. The same mobile source criteria pollutant emission factors were used as in the DEIR.[4] Full calculation methodology details can be found in DEIR Appendix AQT Appendix A. Mobile emissions for Alternative FO can be found in **Table 3-4** and for Alternative HO in **Table 3-5**. Mobile emissions for the on-road construction vehicles are shown in **Table 3-6.**

3.4.2.1 Entrained Roadway Dust

The BAAQMD significance thresholds include operational-related mass emissions thresholds for PM_{10} and $PM_{2.5}$. The operational mobile emissions presented in the DEIR Appendix AQT include vehicle emissions from the EMFAC2014 model, which contains PM_{10} and $PM_{2.5}$ from exhaust, brakewear, and tirewear, but does not include roadway dust.[5] BAAQMD subsequently clarified that roadway dust should be included in the emissions to compare to the operational thresholds. This memorandum therefore quantifies and includes fugitive roadway dust for both FO and HO Alternatives and revises the 2018 Baseline and 2035 Project scenarios to include fugitive roadway dust. Resulting comparisons to significance thresholds are presented in Section 5.2. As noted there, incorporating entrained roadway dust emissions does not result in any new significant impacts for the Project.

A methodology consistent with CalEEMod® was used to develop the entrained roadway dust inventory for the 2018 Baseline, 2035 Project, and FO and HO Alternatives. As described in the CalEEMod® calculation guide, "Vehicles that drive on both paved and unpaved roads generate fugitive dust by dispersing the silt from the roads."[6] The California Air Resources Board (ARB) provides a methodology for entrained roadway dust that utilizes the U.S. Environmental Protection Agency (USEPA) AP-42 method and incorporates the effects of precipitation and region-specific silt loading values that depend on the roadway type.[7] This

---

[4] A newer version of this database, EMFAC2017, was officially released on December 22, 2017, after the publishing of the DEIR. To maintain consistency with DEIR methods and allow for side-by-side comparisons across Project scenarios and Alternatives, the same database as used in the DEIR, EMFAC2014, was used in this Alternatives analysis. In addition, EMFAC2017 has not yet been approved by the USEPA.

[7] ARB. 2016. Miscellaneous Process Methodology 7.9 Entrained Road Travel, Paved Road Dust. Available at: https://www.arb.ca.gov/ei/areasrc/fullpdf/full7-9_2016.pdf. November.

refined methodology is also used by the BAAQMD in the development of their Roadway Screening Analysis Calculator.[8]

To calculate an entrained roadway dust emission factor in pounds of PM_{10} and $PM_{2.5}$ per VMT, data for Santa Clara County as presented in the ARB Entrained Road Dust Methodology was used.[9] These calculations are shown in **Table 3-7**. Total $PM_{2.5}$ and PM_{10} emissions from entrained roadway dust are calculated using these emissions factors and the vehicle miles traveled (VMT) associated with the 2018 Baseline, 2035 Project, FO Alternative, and HO Alternative scenarios.

3.4.3 Emergency Generators

Increased residential housing from the proposed Alternatives will not impact emergency generator emissions, so these remain unchanged from Project emissions presented in the DEIR. **Table 3-8** presents emergency generator emissions for Alternatives FO and HO.

3.4.4 Laboratories

Increased residential housing from the proposed Alternatives will not impact laboratory emissions, so these remain unchanged from Project emissions presented in the DEIR. **Table 3-9** presents laboratory emissions for Alternatives FO and HO.

3.4.5 Fuel Stations

Increased residential housing from the proposed Alternatives will not impact emissions from the Stanford on-campus fleet fuel station, so these remain unchanged from Project emissions presented in the DEIR. **Table 3-10** presents fuel station emissions for Alternatives FO and HO.

3.5 Criteria Air Pollutant Alternatives Inventories in Context

A category-by-category comparison of emissions between the Project inventory and the two Alternatives is shown in **Table 3-1**. The correction to include entrained roadway dust is reflected in the 2035 Project inventory below. Due to the increases in building energy use and traffic, total mass emissions of CAPs increase for the HO and FO Alternatives compared to the Project.

A summary of total emissions for each inventory is shown in **Table 3-11 and Figure 3-5**.

Table 3-11. Stanford CAP Emissions

	CAP Emissions (ton/yr)					
Inventory Year	NO_X	CO	SO_2	ROG	PM_{10}	$PM_{2.5}$
2035 (Project)	49	165	0.69	40	42	12
2035 (Alternative FO)	53	187	0.78	45	49	14
2035 (Alternative HO)	51	176	0.74	43	46	13

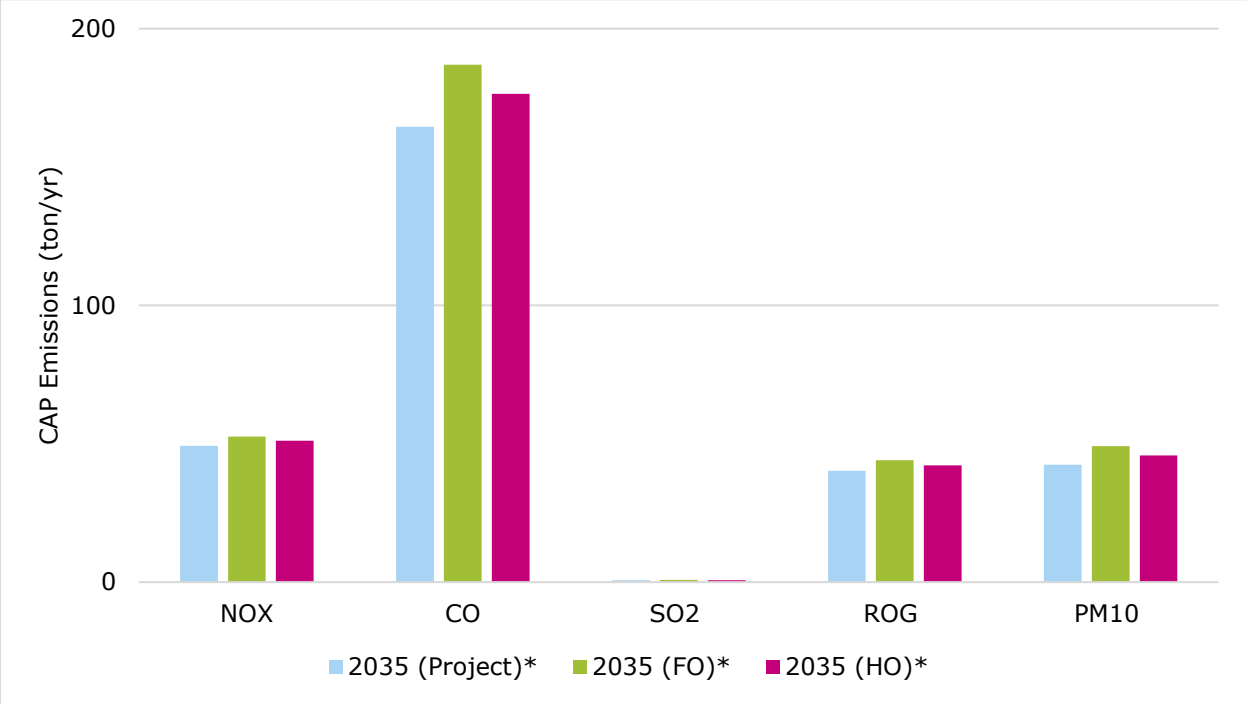
Figure 3-5. Stanford CAP Emissions for Project and Alternatives



*As described in Section 2.1, the 2035 inventories are based on 2030 emission factors. This is conservative, as the mobile emission factors are expected to continue to decrease after 2030.

4. Toxic Air Contaminant Emissions Inventories

This section describes the methodology that Ramboll used to develop the Alternatives TAC emission inventories, which include operational emissions. Construction activities also result in the emissions of DPM, a recognized TAC in California. Since DPM is assumed to be all PM_{10}, and PM_{10} is discussed and calculated in the CAP section, the methodology for calculating construction emissions is not further discussed here. Sub-categories of TAC operational emissions include: natural gas combustion, mobile sources, emergency generators, laboratories, and fuel stations. Full details on the calculation methodology for existing condition and Project inventory development are provided in **DEIR Appendix AQT Appendix A.**

4.1 Operational Emissions – Existing Conditions and Alternatives

4.1.1 Natural Gas

The same activity data (natural gas usage) used for estimating CAP emissions, as described in Section 3.4.1, are also used for calculating TAC emissions.

Benzene, formaldehyde, and toluene are the only TACs evaluated by the BAAQMD for natural gas combustion. TAC emissions from natural gas sources are summarized for Alternative FO in **Table 4-1** and for Alternative HO in **Table 4-2**.

4.1.2 Mobile Sources

TAC emissions associated with on-road mobile sources are generated from residents, workers, visitors, and delivery vehicles visiting the various land use types at Stanford.

DPM, benzene, and 1,3-butadiene emissions were estimated from fuel combustion of mobile sources. BAAQMD CEQA Guidelines indicate that these three pollutants represent a substantial portion of the ambient background risk from TACs in the Bay Area Basin. DPM emissions were assumed to be equivalent to PM_{10} emissions from diesel-powered mobile sources. The methodology for calculating PM_{10} emissions are presented in Section 3.4.2 and in **DEIR Appendix AQT Appendix A.** Benzene and 1,3-butadiene are components of ROG and total organic gas (TOG) emissions (presented in Section 3.4.2), so emissions from total ROG (for diesel mobile sources) or TOG emissions (for gasoline mobile sources) were speciated to determine the benzene and 1,3-butadiene emissions. Benzene and 1,3-butadiene account for 92% of the cancer risk from all toxic compounds listed in the speciation of TOG due to Tailpipe Emissions, shown in Table 14 of the BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (2012). Therefore, only those two compounds are included for gasoline TAC calculations.

The same activity data (i.e., VMT, vehicle trips, brake horsepower per hour) used to calculate CAP emissions, as described in Section 3.4.2, are used to calculate TAC emissions.

TAC emissions from mobile sources are summarized in for Alternatives FO in **Tables 4-3** and for Alternative HO in **Table 4-4**.[10]

4.1.3 Emergency Generators

DPM emissions were conservatively assumed to be equivalent to PM_{10} emissions from emergency generators. Methodology for calculating PM_{10} emissions are presented in Section 3.4.3 above.

Emissions estimates for DPM from emergency generators are shown in **Table 3-8** for Alternative FO and Alternative HO, under PM_{10} emissions.

4.1.4 Laboratories

The methodology for the calculation of TAC emissions from laboratories is described in Section 3.4.4 above.

Emissions estimates are shown in for Alternative FO and Alternative HO in **Table 3-9**.

4.1.5 Fuel Stations

ROG emissions estimated in Section 3.4.5 were speciated to assume that 0.3% of total emissions are benzene. The calculation methodology is described in detail in DEIR Appendix AQT Appendix A.

Emissions estimates are shown in **Table 4-5** for Alternatives FO and Alternative HO.

4.2 Toxic Air Contaminant Alternatives Inventories in Context

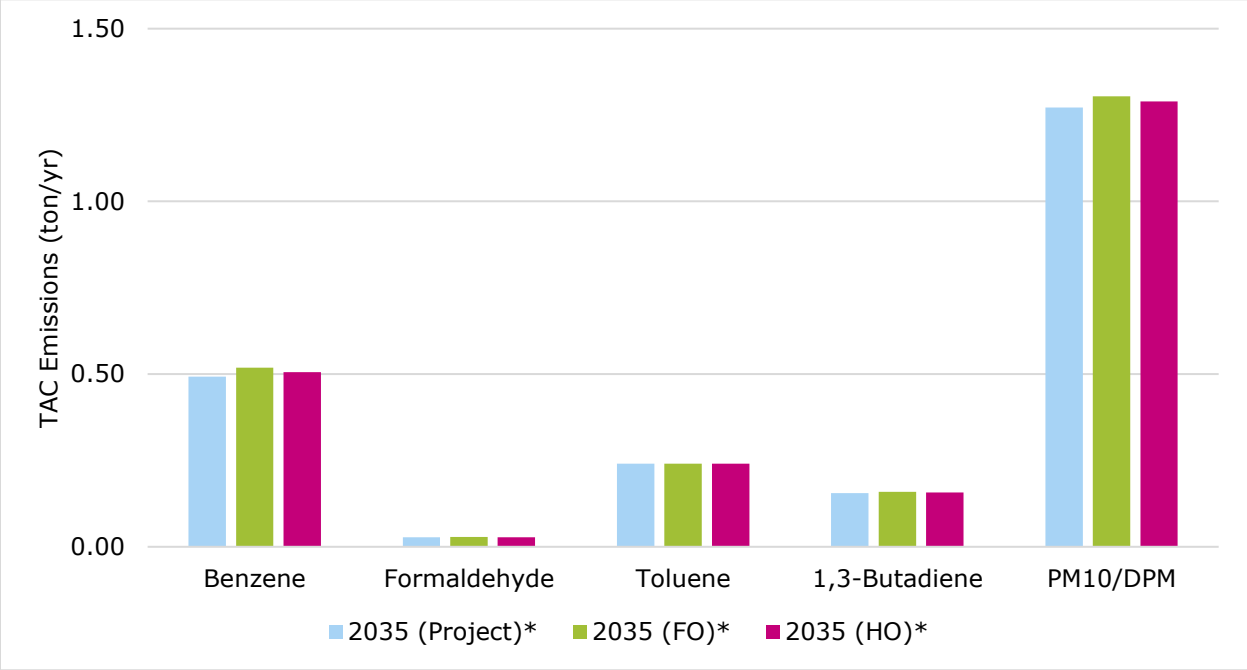
A category-by-category comparison of TAC emissions between the Project and Alternatives inventories is shown in **Table 4-5**. The TACs shown in this summary table are those evaluated by the BAAQMD for natural gas combustion and fuel combustion for mobile sources, which represent a substantial portion of ambient background risk from TACs in the Bay Area. Therefore, this report focuses on these five TACs. The other 89 laboratory chemicals for which emissions were calculated are shown in **Table 3-9**. Due to the increase in housing and mobile trips, total mass emissions of all five TACs that are tracked in the emissions inventory increase slightly for the HO and FO Alternatives compared to the Project. A summary of TAC emissions over time is shown in **Table 4-6 and Figure 4-2.**

[10] Entrained roadway dust is not included here, as it is not DPM.

Table 4-6. Stanford TAC Emissions					
	TAC Emissions (ton/yr)				
Inventory Year[1]	Benzene	Formaldehyde	Toluene	1,3-Butadiene	PM_{10}/DPM
2035 (Project)	0.49	0.027	0.241	0.156	1.27
2035 Alternative FO	0.52	0.028	0.241	0.159	1.30
2035 Alternative HO	0.51	0.028	0.241	0.157	1.29

[1] As described in Section 2.1, the 2035 inventories are based on 2030 emission factors. This is conservative, as the mobile emission factors are expected to continue to decrease after 2030.

Figure 4-2. Stanford TAC Emissions for Project and Alternatives



*As described in Section 2.1, the 2035 inventories are based on 2030 emission factors. This is conservative, as the mobile emission factors are expected to continue to decrease after 2030.

5. Impact Assessment and Mitigation Measures

Air quality standards of significance and thresholds are discussed in DEIR Appendix AQT Section 5. The comparisons of each Alternative to the corresponding thresholds are shown below.

5.1 Construction Impacts

Impact AQ-1a: Alternative FO Construction Would Not Result in Emissions of NOx, PM, and ROGs above BAAQMD Significance Thresholds. *(Less than Significant without Mitigation)*

As described in section 3.3, Alternative FO would generate construction emissions from a variety of sources, including the following: off-road construction equipment; and on-road worker, vendor, and hauling vehicles. A summary of emissions for the average annual scenario and comparison to thresholds is shown in **Table 5-1.** The peak construction year under the FO Alternative is expected to remain consistent with the peak construction year evaluated under the Project. Even if the new proposed housing units/beds are constructed non-uniformly across the 18 years of the Project, no single year is anticipated to have an amount of construction that would exceed the peak construction year evaluated under the Project. CalEEMod® outputs for the additional average annual housing for Alternatives FO and HO are shown in Appendix A. CalEEMod® outputs for the Project are shown in the DEIR Appendix AQT Appendix B. Consistent with the DEIR, to be conservative, construction emissions associated with the 2018 General Use Permit and Alternatives are evaluated as new emissions here, without subtracting the baseline emissions.

Table 5-1: Alternative FO Average Daily Construction Emissions

	Average Daily Emissions (pounds/day)[1]			
	ROG	**NOx**	**Exhaust PM_{10}[2]**	**Exhaust $PM_{2.5}$[2]**
DEIR Project Construction Emissions (Average Scenario)[3]	14.9	22.0	2.8	1.3
Additional Construction Off-Road Equipment for FO Alternative	7.7	4.1	0.08	0.08
Additional Construction On-Road Trips for FO Alternative	1.0	13.5	0.36	0.18
Total	23.5	39.6	3.3	1.6
Increase from Project to FO Alternative	58%	80%	16%	20%
Significance Threshold	54	54	82	54
Above Threshold?	No	No	No	No

[1] Construction emissions in lbs/day were calculated by dividing the total CAP emissions by the number of working days in a year.

[2] Exhaust PM includes tire wear and brake wear PM for on-road vehicles. The BAAQMD Thresholds do not include these sources so the comparison is conservative.

[3] It is assumed that the "peak" construction year does not change due to the FO Alternative.

<u>Impact AQ-1b:</u> Alternative HO Construction Would Not Result in Emissions of NOx, PM, and ROGs above BAAQMD Significance Thresholds. *(Less than Significant without Mitigation)*

As described in section 3.3, Alternative HO would generate construction emissions from a variety of sources, including the following: off-road construction equipment; and on-road worker, vendor, and hauling vehicles. A summary of emissions for the average annual scenario and comparison to thresholds is shown in **Table 5-2.** The peak construction year under the HO Alternative is expected to remain consistent with the peak construction year evaluated under the Project. Even if the new proposed housing units/beds are constructed non-uniformly across the 18 years of the Project, no single year is anticipated to have an amount of construction that would exceed the peak construction year evaluated under the Project. CalEEMod® outputs for the additional average annual housing for Alternatives FO and HO are shown in Appendix A. CalEEMod® outputs for the Project are shown in the DEIR Appendix AQT Appendix B. Consistent with the DEIR, to be conservative, construction emissions associated with the 2018 GUP and Alternatives are evaluated as new emissions here, without subtracting the baseline emissions.

Table 5-2: Alternative HO Average Daily Construction Emissions

	Average Daily Emissions (pounds/day)[1]			
	ROG	**NOx**	**Exhaust PM_{10}[2]**	**Exhaust $PM_{2.5}$[2]**
DEIR Project Construction Emissions (Average Scenario)[3]	14.9	22.0	2.8	1.3
Additional Construction Off-Road Equipment for HO Alternative	3.9	3.5	0.06	0.06
Additional Construction On-Road Trips for HO Alternative	0.5	6.7	0.18	0.09
Total	19.3	32.3	3.1	1.4
Increase from Project to HO Alternative	30%	47%	8%	11%
Significance Threshold	54	54	82	54
Above Threshold?	No	No	No	No

[1] Construction emissions in lbs/day were calculated by dividing the total CAP emissions by the number of working days in a year.

[2] Exhaust PM includes tire wear and brake wear PM for on-road vehicles. The BAAQMD Thresholds do not include these sources so the comparison is conservative.

[3] It is assumed that the "peak" construction year does not change due to the HO Alternative.

Impact AQ-2a: With Inclusion of BAAQMD-Recommended Basic Construction Mitigation Measures, Alternative FO Construction Would Not Result in Significant, Localized Dust-related Air Quality Impacts. *(Less than Significant with Mitigation[11])*

As described in the DEIR Appendix AQT Section 5.2.1, according to BAAQMD significance thresholds, a project would not have a significant adverse air quality impact associated with construction dust if applicable BAAQMD-recommended construction best management practices are required as mitigation measures and implemented during construction activities. Like the Project, Alternative FO would implement best management practices (BMPs) to ensure that fugitive dust for construction would result in less-than-significant impacts. This mitigation also contains measures that would reduce emissions from construction equipment engine exhaust.

Impact AQ-2b: With Inclusion of BAAQMD-Recommended Basic Construction Mitigation Measures, Alternative HO Construction Would Not Result in Significant, Localized Dust-related Air Quality Impacts. *(Less than Significant with Mitigation[12])*

As described in the DEIR Appendix AQT Section 5.2.1, according to BAAQMD significance thresholds, a project would not have a significant adverse air quality impact associated with construction dust if applicable BAAQMD-recommended construction best management practices are required as mitigation measures and implemented during construction activities. Like the Project, Alternative HO would implement best management practices (BMPs) to ensure that fugitive dust for construction would result in less-than-significant impacts. This mitigation also contains measures that would reduce emissions from construction equipment engine exhaust.

Impact AQ-3a: Alternative FO Construction Would Not Generate Emissions of TAC and $PM_{2.5}$ At Levels That Would Result in Health Risks above BAAQMD Significance Thresholds. *(Less than Significant with Mitigation[13])*

DEIR Appendix AQT Section 5.2.1 describes the BAAQMD significance thresholds for TAC and $PM_{2.5}$ from construction and dominant contributors to construction health risks. Although total emissions from construction activities were estimated, it is not possible to conduct a health risk assessment (HRA) for each discrete project that will occur through 2035. Accordingly, a screening tool was developed to ensure future construction activities would not result in emissions of toxic air contaminants exceeding BAAQMD health risk significance thresholds. The screening tool provides minimum distances to site new projects depending on size and proximity to sensitive receptors such as children, as shown in DEIR Appendix AQT Table 5-2-2. If a project does not fit within the screening tool parameters, Stanford shall submit to the County Planning Office a project-specific health risk analysis demonstrating that project construction activities will not result in a significant acute, chronic non-cancer or cancer-related health risk to sensitive receptors. These measures would remain applicable for

[11] Proposed mitigation under Alternative FO is consistent with the mitigation measure proposed in DEIR Table 1-2, Impact 5.2-2.

[12] Proposed mitigation under Alternative HO is consistent with the mitigation measure proposed in DEIR Table 1-2, Impact 5.2-2.

[13] Proposed mitigation under Alternative FO is consistent with the mitigation measures proposed in DEIR Table 1-2, Impact 5.2-3.

Alternative FO and would ensure less-than-significant impacts on health risk from construction activities.

Impact AQ-3b: Alternative HO Construction Would Not Generate Emissions of TAC and $PM_{2.5}$ At Levels That Would Result in Health Risks above BAAQMD Significance Thresholds. *(Less than Significant with Mitigation[14])*

DEIR Appendix AQT Section 5.2.1 describes the BAAQMD significance thresholds for TAC and $PM_{2.5}$ from construction and dominant contributors to construction health risks. Although total emissions from construction activities were estimated, it is not possible to conduct a health risk assessment (HRA) for each discrete project that will occur through 2035. Accordingly, a screening tool was developed to ensure future construction activities would not result in emissions of toxic air contaminants exceeding BAAQMD health risk significance thresholds. The screening tool provides minimum distances to site new projects depending on size and proximity to sensitive receptors such as children. If a project does not fit within the screening tool parameters, Stanford shall submit to the County Planning Office a project-specific health risk analysis demonstrating that project construction activities will not result in a significant acute, chronic non-cancer or cancer-related health risk to sensitive receptors. These measures would remain applicable for Alternative HO and would ensure less-than-significant impacts on health risk from construction activities.

5.2 Operational Impacts

Impact AQ-4 (Revised to Include Entrained Roadway Dust): Project Operations Would Not Result in Emissions of NOx, PM, and ROGs above BAAQMD Significance Thresholds. *(Less than Significant without Mitigation)*

As described in Section 3.4.2.1, the calculations of 2018 Baseline and 2035 Project operational emissions have been revised to incorporate PM_{10} and $PM_{2.5}$ emissions from entrained roadway dust. This section revises the results shown in the DEIR Appendix AQT Section 5.2.2.

The proposed Project would generate operational emissions from a variety of sources, including the following: new vehicle trips and offroad area sources; maintenance operation of diesel emergency generators and boilers; new laboratories; and fueling stations. Because construction activity is on-going and construction emissions would occur throughout the life of the General Use Permit, emissions from off-road construction equipment have been included in the operational emissions. Details on CAP emission calculations are shown in DEIR Appendix AQT Appendix A.

USEPA emission factors were used for the emergency generators and boilers. Vehicle trip emissions were calculated using EMFAC2014 emissions factors from ARB, based on vehicle trip generation rates developed for this project. Entrained roadway dust emissions have been added to mobile emissions using the methodology described in Section 3.4.2.1.

The results of the project operational criteria air pollutant emissions calculations are presented in **Table 5-3**. Details on calculations and methodology are provided in the DEIR Appendix AQT Appendix A, with the additional roadway dust characterization discussed in Section 3.4.2.1. Table 5-3 indicates that operational criteria air pollutant emissions of the proposed project would result in emissions of criteria pollutants and precursors that would be below thresholds

[14] Proposed mitigation under Alternative HO is consistent with the mitigation measures proposed in DEIR Table 1-2, Impact 5.2-3.

of significance for all pollutants. Therefore, impacts from emissions of NOx, PM, and or ROGs from operational activities are **less than significant**.

Table 5-3: Average Daily And Maximum Annual Operational Emissions (Change from Fall 2018 to Fall 2035)

	Average Daily Emissions (pounds/day)[1]			
	ROG	**NOx**	**PM_{10}**	**$PM_{2.5}$ [2]**

Table 5-3: Average Daily And Maximum Annual Operational Emissions (Change from Fall 2018 to Fall 2035)				
Other Natural Gas (e.g., PGE boilers)	0.3	4.7	0.4	0.4
Emergency Generators	0.01	1.6	0.05	0.05
Laboratories	3.4	-	-	-
Fuel Stations	-0.04	-	-	-
Total	-6.5	-32	9.4	2.3
Significance Threshold	10	10	15	10
Above Threshold?	No	No	No	No

[1] Average daily emissions are calculated by dividing the annual average emissions by 365 days.

[2] For purpose of this comparison, $PM_{2.5}$ is conservatively assumed to equal PM_{10} for all non-mobile sources, though in reality only a fraction of total PM_{10} is $PM_{2.5}$.

Impact AQ-4a: Alternative FO Operations Would Not Result in Emissions of NOx $PM_{2.5}$, and ROGs above BAAQMD Significance Thresholds. *(Less than Significant without Mitigation)* Alternative FO Operations Would Result in Emissions of PM_{10} above BAAQMD Significance Thresholds. *(Significant and Unavoidable)*

As described above, Alternative FO would generate operational emissions from a variety of sources, including the following: new vehicle trips and offroad area sources; maintenance operation of diesel emergency generators and boilers; new laboratories; and fueling stations. Because construction activity is on-going and construction emissions occur throughout the life of the General Use Permit, emissions from off-road construction equipment have been included in the operational emissions.

The results of the operational criteria air pollutant emissions calculations are presented in **Table 5-4**. Table 5-4 indicates that operational criteria air pollutant emissions of Alternative FO would result in emissions of criteria pollutants and precursors that would be below thresholds of significance for NOx, $PM_{2.5}$, and ROGs, but above the threshold of significance for PM_{10}. Therefore, impacts from emissions of NOx, $PM_{2.5}$, and ROGs from operational activities are **less than significant**, while impacts from PM_{10} from operational activities are **significant**.

PM_{10} emissions associated with Alternative FO are dominated by mobile sources. Stanford is converting the majority of its campus fleet vehicles and all of its Marguerite shuttles to electric vehicles and is installing electric vehicle charging stations to encourage the use of private

zero-emission vehicles.[15] However, Stanford cannot control the fuels used in private vehicles. Mitigation Measure 5.15-2 would reduce mobile emissions to the extent the No Net New Commute Trips standard is achieved; however, this is considered a significant and unavoidable impact because it is uncertain whether this measure would reduce mobile emissions below the significance threshold.

Table 5-4: Average Daily And Maximum Annual Operational Emissions (Change from Fall 2018 to FO Alternative)

	Average Daily Emissions (pounds/day)[1]			
	ROG	**NOx**	**PM_{10}**	**$PM_{2.5}$ [2]**

Total	-4.1	-31	12.8	3.1
Significance Threshold	10	10	15	10
Above Threshold?	No	No	No	No

[1] Average daily emissions are calculated by dividing the annual average emissions by 365 days.

[2] For purpose of this comparison, $PM_{2.5}$ is conservatively assumed to equal PM_{10} for all non-mobile sources, though in reality only a fraction of total PM_{10} is $PM_{2.5}$.

Impact AQ-5a: Alternative FO Operations Would Not Generate Emissions of TAC and $PM_{2.5}$ That Would Result in Health Risks above BAAQMD Significance Thresholds. ***(Less than Significant with Mitigation[16])***

As described in DEIR Appendix AQT Section 5.2.2, the sources of TAC emissions that would occur during the operational phase of the project include emissions from mobile sources (passenger vehicles and delivery vehicles), and stationary sources (diesel generators and laboratory fume hood stacks).

Alternative FO is not anticipated to result in any changes to diesel generators or laboratories compared to the Project and would follow the same mitigation measures as the Project.

TAC and $PM_{2.5}$ emissions from mobile sources will be reduced under Alternative FO compared to baseline conditions, resulting in a reduction of health risks from mobile sources. Consequently, the Project is considered to have a less than significant impact with regard to health risks from mobile sources and risks from mobile sources were not further evaluated.

As described in Section 4.1.1, natural gas combustion results in emissions of benzene, formaldehyde, and toluene. Under the Project, there would be an increase in these TAC emissions due to an increase in natural gas combustion associated with residential and non-residential growth, as shown in **Table 4-1**. However, these increases would be minimal and any newly permitted sources would meet BAAQMD standards. Therefore, impacts on health risks from natural gas combustion would be less than significant.

Therefore, impacts to health risk from emissions of TACs and $PM_{2.5}$ from operational activities would be **less than significant**.

[16] Proposed mitigation under Alternative FO is consistent with the mitigation measure proposed in DEIR Table 1-2, Impact 5.2-5.

Impact AQ-5b: Alternative HO Operations Would Not Generate Emissions of TAC and $PM_{2.5}$ That Would Result in Health Risks above BAAQMD Significance Thresholds. *(Less than Significant with Mitigation[17])*

As described in DEIR Appendix AQT Section 5.2.2, the sources of TAC emissions that would occur during the operational phase of the project include emissions from mobile sources (passenger vehicles and delivery vehicles), and stationary sources (diesel generators and laboratory fume hood stacks).

Alternative HO is not anticipated to result in any changes to diesel generators or laboratories compared to the Project and would follow the same mitigation measures as the Project.

TAC and $PM_{2.5}$ emissions from mobile sources will be reduced under Alternative FO compared to baseline conditions, resulting in a reduction of health risks from mobile sources. Consequently, the Project is considered to have a less than significant impact with regard to health risks from mobile sources and risks from mobile sources were not further evaluated.

As described in Section 4.1.1, natural gas combustion results in emissions of benzene, formaldehyde, and toluene. Under the Project, there would be an increase in these TAC emissions due to an increase in natural gas combustion associated with residential and non-residential growth, as shown in **Table 4-2**. However, these increases would be minimal and any newly permitted sources would meet BAAQMD standards. Therefore, impacts on health risks from natural gas combustion would be less than significant.

Therefore, impacts to health risk from emissions of TACs and $PM_{2.5}$ from operational activities would be **less than significant**.

Impact AQ-6a: Alternative FO Operations Would Not Result in Local Concentrations of CO above BAAQMD Significance Thresholds. *(Less than Significant without Mitigation)*

BAAQMD provides a screening methodology based on peak hourly traffic volumes to evaluate potential impacts of CO emissions from mobile sources. The screening methodology focuses on intersections with vehicle traffic exceeding 44,000 vehicles per hour after FO Alternative buildout (or 24,000 vehicles per hour in locations with limited vertical or horizontal air mixing) that could violate or contribute to a violation of ambient air quality standards for CO. Based on the estimated FO Alternative-related traffic and existing traffic in the area, it is not expected that any of the intersections near the FO Alternative would experience more than 24,000 vehicles per hour at full buildout. Thus, the FO Alternative would not be expected to contribute to a violation of CO air quality standards.

Therefore, impacts to local concentrations of CO from operational activities are **less than significant**.

Impact AQ-6b: Alternative HO Operations Would Not Result in Local Concentrations of CO above BAAQMD Significance Thresholds. *(Less than Significant without Mitigation)*

BAAQMD provides a screening methodology based on peak hourly traffic volumes to evaluate potential impacts of CO emissions from mobile sources. The screening methodology focuses on intersections with vehicle traffic exceeding 44,000 vehicles per hour after HO Alternative

[17] Proposed mitigation under Alternative HO is consistent with the mitigation measure proposed in DEIR Table 1-2, Impact 5.2-5.

buildout (or 24,000 vehicles per hour in locations with limited vertical or horizontal air mixing) that could violate or contribute to a violation of ambient air quality standards for CO. Based on the estimated FO Alternative-related traffic and existing traffic in the area, it is not expected that any of the intersections near the HO Alternative would experience more than 24,000 vehicles per hour at full buildout. Thus, the HO Alternative would not be expected to contribute to a violation of CO air quality standards.

Therefore, impacts to local concentrations of CO from operational activities are **less than significant**.

5.3 General Impacts

Impact AQ-7a: Alternative FO Would Not Result in Objectionable Odors. (*Less than Significant without Mitigation)*

The BAAQMD CEQA Guidelines identify wastewater treatment plants, oil refineries, asphalt plants, chemical manufacturing, painting/coating operations, coffee roasters, food processing facilities, recycling operations and metal smelters as odor sources of particular concern, and recommends buffer zones of one to two miles around them to avoid potential odor conflicts. The potential for the FO Alternative to result in objectionable odors is **less than significant**.

Impact AQ-7b: Alternative HO Would Not Result in Objectionable Odors. *(Less than Significant without Mitigation)*

The BAAQMD CEQA Guidelines identify wastewater treatment plants, oil refineries, asphalt plants, chemical manufacturing, painting/coating operations, coffee roasters, food processing facilities, recycling operations and metal smelters as odor sources of particular concern, and recommends buffer zones of one to two miles around them to avoid potential odor conflicts. The potential for the HO Alternative to result in objectionable odors is **less than significant**.

Impact AQ-8a: Alternative FO Would Not Conflict with Existing Air Quality Plans. *(Less than Significant with Mitigation[18])*

DEIR Appendix AQT Section 5.2.3 describes the 2010 Clean Air Plan and consistency with 2010 BAAQMD CEQA Guidelines. The FO Alternative will not change the programs that Stanford provides to further the goals of the Clean Air Plan and is not expected to conflict with or obstruct implementation of the Clean Air Plan. Therefore, the FO Alternative's impacts relative to the goals of the Clean Air Plan would be **less than significant**.

Impact AQ-8b: Alternative HO Would Not Conflict with Existing Air Quality Plans. *(Less than Significant with Mitigation[19])*

DEIR Appendix AQT Section 5.2.3 describes the 2010 Clean Air Plan and consistency with 2010 BAAQMD CEQA Guidelines. The HO Alternative will not change the programs that Stanford provides to further the goals of the Clean Air Plan and is not expected to conflict with or obstruct implementation of the Clean Air Plan. Therefore, the HO Alternative's impacts relative to the goals of the Clean Air Plan would be **less than significant**.

[18] Proposed mitigation under Alternative FO is consistent with the mitigation measures proposed in DEIR Table 1-2, Impact 5.2-8.

[19] Proposed mitigation under Alternative HO is consistent with the mitigation measures proposed in DEIR Table 1-2, Impact 5.2-8.

5.4 Cumulative Impacts

Impact AQ-9a: Alternative FO Would Not Result in Operational Emissions of NOx, $PM_{2.5}$, or ROGs that are Cumulatively Considerable. *(Less than Significant without Mitigation)* Alternative FO Would Result in Operational Emissions of PM_{10} that are Cumulatively Considerable. *(Significant and Unavoidable)*

BAAQMD developed thresholds of significance with consideration of individual project emission levels that would be cumulatively considerable. If a project exceeds the identified project significance levels, then its emissions would be cumulatively considerable. Table 5-4 shows that FO Alternative operational and construction emissions would not exceed emission thresholds for NOx, $PM_{2.5}$, or ROGs. Therefore emissions of NOx, $PM_{2.5}$, or ROGs from the FO Alternative would not result in a cumulatively considerable contribution to a cumulative air quality impact. Since the FO Alternative operational emissions shown in Table 5-4 would exceed emissions thresholds for PM_{10}, the FO Alternative would result in a significant cumulative air quality impact for PM_{10}.

Impact AQ-9b: Alternative HO Would Not Result in Operational Emissions of NOx, PM, or ROGs that are Cumulatively Considerable. *(Less than Significant without Mitigation)*

BAAQMD developed thresholds of significance with consideration of individual project emission levels that would be cumulatively considerable. If a project exceeds the identified project significance levels, then its emissions would be cumulatively considerable. Table 5-5 shows that HO Alternative operational and construction emissions would not exceed emission thresholds for NOx, PM, or ROGs. Therefore emissions of NOx, PM, or ROGs from the HO Alternative would not result in a cumulatively considerable contribution to a cumulative air quality impact.

Notes:

1. Fall 2035 represents full buildout of the Project. Mobile emission factors are conservatively used from year 2030, to be consistent with the GHG report and comparison to State 2030 targets.
2. The FO and HO Alternatives inventories include emissions changes due to additional graduate student beds and faculty/staff housing compared to the Project.
3. $PM_{2.5}$ has conservatively been assumed to equal PM_{10} for non-mobile sources.
4. Entrained road dust has been added for consistency with BAAQMD operational thresholds, as described in Section 3.4.2.1.
5. For the Project inventory, construction emissions are estimated using CalEEMod® 2013.2.2 using the average annual square footage of construction and demolition and estimated excavation from fiscal year 2001 through fiscal year 2015 with default construction schedules and equipment lists. For the Alternatives inventories, construction emissions are added for the annual average number of additional dwelling units. For all inventories, construction equipment is all assumed to meet Final Tier 4 standards, except for chainsaws and paving phase equipment. Construction on-road emissions (worker, vendor, and hauling trips) are included in the mobile sources.

Abbreviations:

CalEEMod® - California Emission Estimator Model
CAP - criteria air pollutants
CO - carbon monoxide
FO - full offset
PGE - Pacific Gas & Electric
PM_{10} - particulate matter under 10 microns
ROG - reactive organic gas
GHG - greenhouse gas
HO - half offset
NOx - nitrogen oxides
PGE - Pacific Gas & Electric
$PM_{2.5}$ - particulate matter under 2.5 microns in diameter
PM_{10} - particulate matter under 10 microns in diameter
ROG - reactive organic gas
SO_2 - sulfur dioxide
ton - short tons
yr - year

PGE Searsville/Olmstead Housing[5]	1,341	0%	1,341						0.066	0.055	0.00039	0.0036	0.0050
PGE New Faculty/Staff Housing[6]	0	N/A	34,339						1.7	1.4	0.010	0.093	0.13
Total	**577,799**		**747,236**						**26.5**	**39.6**	**0.22**	**2.1**	**2.8**

Notes:

1. Fall 2018 Annual Natural Gas usage details are shown in DEIR Appendix AQT Table 3-4-4.
2. Scaling for Fall 2035 is primarily based on the increase in academic square footage and student beds expected from Fall 2018 to full buildout of the 2018 GUP, including the increase in housing for this Alternative. The majority of PGE Residential addresses are student housing, so the increase is based on number of beds. PGE Commercial, the Hot Water Generators, and the Replacement Process Steam Plant serve largely academic buildings, so the increase is based on academic square footage. Estimates for new faculty/staff housing are added. The six individual replacement boilers are not expected to increase in use. Gas use is assumed to scale linearly; i.e., efficiency and use in new buildings is assumed equal to current buildings. This is likely very conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to result in lower natural gas usage in new buildings.
3. Hot Water Generator and Replacement Process Steam Plant boiler emission factors were provided by Stanford; the hot water generator emission factors are from the vendor except for SO_2 from AP-42. The replacement process steam plan NOx and CO factors are based on BAAQMD Regulation 9-7, with all other emission factors from Table 1.4-2 of Section 1.4 (Natural Gas Combustion) of AP-42. For the remaining boilers, USEPA AP-42 emission factors were used for general natural gas use and exampt small boilers. The emission factors were converted from lb/106 scf to lb/MMBtu using BAAQMD default high heating value of 1,020 BTU/scf for natural gas. We assume that individual replacement boilers are covered by general natural gas use and that estimates are conservative by doing so. See table below for emission factor comparison.

Source	NO_X	CO	SO_2	ROG	PM_{10}	EF Source
	[lb/MMBtu]					
General Natural Gas	0.098039	0.082353	0.000588	0.005392	0.007451	AP-42
Exempt Small Boilers	0.098039	0.082353	0.000588	0.005392	0.007451	AP-42
Individual Replacement Boilers	0.037	0.3001	0.000588	0.005392	0.007451	AP42; 30 ppmv for NO_x, 400 ppmv for CO

4. The six individual replacement boilers are not expected to increase in gas consumption. Based on matching up PGE commercial addresses, estimated the gas consumption from these boilers and separated this from the total PGE commercial gas. Not all boilers addresses could be matched, and not all gas used at a given address is necessarily due to the boilers, so this breakdown is approximate.
5. Areas on campus for which Stanford did not provide detailed gas data include the Searsville Block and Olmsted Staff faculty/staff housing. The annual gas use is based on the CalEEMod® version 2013.2.2 default for single family homes built to 2008 Title 24 standards in climate zone 4.
6. This represents the natural gas consumption from the 2,892 new faculty/staff high density homes to be constructed within the study boundary under this alternative. The annual natural gas use is based on the CalEEMod® version 2013.2.2 default for condo/townhouse built to 2008 Title 24 standards in climate zone 4, adjusted to an approximation of 2016 Title 24 standards (effective January 1, 2017). This is likely very conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to require residences to achieve higher efficiency with each code cycle.

Table 3-4
FO Alternative CAP Emissions - Mobile Use
Stanford University
Stanford, CA

Notes:

1. Trip information is provided by Fehr & Peers or derived using data from the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. Greyed out cells are either not needed for this analysis (e.g., off-road equipment trips per year) or irrelevant because the assumptions are already embedded into the VMT analysis (e.g., trip lengths for workers).
2. Number of vehicles and trips per vehicle are used to estimate starting and idling emissions. The number of vehicles for residents is based on parking permits. For workers and other trips types, number of vehicles is based on trips per year divided by commuting or driving to campus days per year. Trip counts for worker and resident trips, visitors, and vendors are provided by Fehr & Peers in the SB 743 Analysis. Trip count for shuttles/buses is provided by Stanford. Bonair, PSSI, and Public Safety trip counts are calculated from total vehicle trips and number of vehicles in the fleet. Total vehicle trips per year calculated from total VMT divided by the trip length or provided by Fehr & Peers.
3. VMT per year for the FO Alternative is based on data provided by Fehr & Peers.
4. VMT for on-road campus vehicles is split into four categories: Bonair, Marguerite, PSSI, and Public Safety. Bonair vehicles are separated by fuel type and vehicle weight class and uses gallons of fuel used with the EMFAC mpg for that vehicle class in Santa Clara county to estimate VMT. Diesel fuel usage, number of vehicles, and trip rate/length was obtained from Stanford and used to estimate PSSI vehicle emissions. Stanford indicated that their on-campus fleet will incorporate higher percentages of electric vehicles over time. The on-campus fleet for the 2018 inventory was estimated to be 40% electric and is expected to be 70% electric by 2035. Since emissions for the 2018 inventory were based on fueling data (no data on electric vehicles), emissions from on-campus vehicles for 2035 are estimated by scaling assuming only 30% non-electric vehicles contribute to emissions in 2035 versus 60% in 2018. Additionally, Stanford expects the entire Marguerite fleet to be electric by 2035. Fuel usage and number of vehicles in the fleet were provided by Stanford for public safety vehicles; these are assumed to be a fleet of light duty vehicles.
5. Fuel usage for off-road Stanford vehicles was provided by Stanford and is assumed to remain constant from 2015 to 2035. Conversion factors (for gas and diesel) were used to convert gallons of fuel to bhp-hr. CalEEMod® emission factors were then used to estimate emissions.
6. Conversion factors from fuel usage in gallons to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES).
7. Off-road equipment emission factors for smaller gasoline equipment are from CalEEMod® Table 7.2 under category "Other Lawn and Garden Equipment." Emission factors for light towers are from CalEEMod® Table 3.4 under category "Generator Sets" and emission factors from diesel off-road equipment are from CalEEMod® Table 3.4 under category "Other General Industrial Equipment" for equipment between 6-50 HP.
8. EMFAC2014 mpg is calculated by summing the VMT for specific weight classes and dividing by the fuel consumption. Emission factors are shown in DEIR Appendix AQT Appendix C.
9. Bhp-hr per year for Siebel and Red Barn off-road equipment is estimated from fuel consumption using a conversion factor (for gas and diesel) to convert from gallons to bhp-hr.
10. Marguerite buses are assumed to all be electric by 2035. By Fall 2018, assumed that the Bonair fleet, by switching from a "service yard" system to a "hub" system, will see a 5% reduction in VMT from Bonair vehicles; this is kept constant through 2035.
11. EMFAC emission factors used for calculating on-road emissions are summarized in DEIR Appendix AQT Appendix C. Entrained road dust emissions are calculated separately and shown in Table 3-7.
12. Vendor and Hauling VMT are based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction. This consists of 37 trips per day, 7.3 miles per trip for the 230 day building construction phase each year for vendor trips, and 7,987 trips per year, 20 miles per trip for haul trips. Additional vendor and hauling trips added for the FO Alternative construction consist of 14 vendor trips/day for 220 days and 10,369 trips/year for haul trucks. These VMT and emissions are a sub-category of the 'Other Trips - Trucks' VMT because these trips would be counted in the Fehr & Peers cordon reconciliation analysis and because the primary vehicle type would be medium- and heavy-duty vehicles. However, EMFAC2014 emission factors consistent with hauling and vendor CalEEMod fleet breakdowns have been used to calculate CAP emissions for comparison with the BAAQMD construction thresholds of significance.

Table 3-5
HO Alternative CAP Emissions - Mobile Use
Stanford University
Stanford, CA

Notes:

1. Trip information is provided by Fehr & Peers or derived using data from the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. Greyed out cells are either not needed for this analysis (e.g., off-road equipment trips per year) or irrelevant because the assumptions are already embedded into the VMT analysis (e.g., trip lengths for workers).
2. Number of vehicles and trips per vehicle are used to estimate starting and idling emissions. The number of vehicles for residents is based on parking permits. For workers and other trips types, number of vehicles is based on trips per year divided by commuting or driving to campus days per year. Trip counts for worker and resident trips, visitors, and vendors are provided by Fehr & Peers in the SB 743 Analysis. Trip count for shuttles/buses is provided by Stanford. Bonair, PSSI, and Public Safety trip counts are calculated from total vehicle trips and number of vehicles in the fleet. Total vehicle trips per year calculated from total VMT divided by the trip length or provided by Fehr & Peers.
3. VMT per year for the HO Alternative is based on data provided by Fehr & Peers.
4. VMT for on-road campus vehicles is split into four categories: Bonair, Marguerite, PSSI, and Public Safety. Bonair vehicles are separated by fuel type and vehicle weight class and uses gallons of fuel used with the EMFAC mpg for that vehicle class in Santa Clara county to estimate VMT. Diesel fuel usage, number of vehicles, and trip rate/length was obtained from Stanford and used to estimate PSSI vehicle emissions. Stanford indicated that their on-campus fleet will incorporate higher percentages of electric vehicles over time. The on-campus fleet for the 2018 inventory was estimated to be 40% electric and is expected to be 70% electric by 2035. Since emissions for the 2018 inventory were based on fueling data (no data on electric vehicles), emissions from on-campus vehicles for 2035 are estimated by scaling assuming only 30% non-electric vehicles contribute to emissions in 2035 versus 60% in 2018. Additionally, Stanford expects the entire Marguerite fleet to be electric by 2035. Fuel usage and number of vehicles in the fleet were provided by Stanford for public safety vehicles; these are assumed to be a fleet of light duty vehicles.
5. Fuel usage for off-road Stanford vehicles was provided by Stanford and is assumed to remain constant from 2015 to 2035. Conversion factors (for gas and diesel) were used to convert gallons of fuel to bhp-hr. CalEEMod® emission factors were then used to estimate emissions.
6. Conversion factors from fuel usage in gallons to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES).
7. Off-road equipment emission factors for smaller gasoline equipment are from CalEEMod® Table 7.2 under category "Other Lawn and Garden Equipment." Emission factors for light towers are from CalEEMod® Table 3.4 under category "Generator Sets" and emission factors from diesel off-road equipment are from CalEEMod® Table 3.4 under category "Other General Industrial Equipment" for equipment between 6-50 HP.
8. EMFAC2014 mpg is calculated by summing the VMT for specific weight classes and dividing by the fuel consumption. Emission factors are shown in DEIR Appendix AQT Appendix C.
9. Bhp-hr per year for Siebel and Red Barn off-road equipment is estimated from fuel consumption using a conversion factor (for gas and diesel) to convert from gallons to bhp-hr.
10. Marguerite buses are assumed to all be electric by 2035. By Fall 2018, assumed that the Bonair fleet, by switching from a "service yard" system to a "hub" system, will see a 5% reduction in VMT from Bonair vehicles; this is kept constant through 2035.
11. EMFAC emission factors used for calculating on-road emissions are summarized in DEIR Appendix AQT Appendix C. Entrained road dust emissions are calculated separately and shown in Table 3-7.
12. Vendor and Hauling VMT are based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction. This consists of 37 trips per day, 7.3 miles per trip for the 230 day building construction phase each year for vendor trips, and 7,987 trips per year, 20 miles per trip for haul trips. Additional vendor and hauling trips added for the HO Alternative construction consist of 7 vendor trips/day for 220 days and 5,184 trips/year for haul trucks. These VMT and emissions are a sub-category of the 'Other Trips - Trucks' VMT because these trips would be counted in the Fehr & Peers cordon reconciliation analysis and because the primary vehicle type would be medium- and heavy-duty vehicles. However, EMFAC2014 emission factors consistent with hauling and vendor CalEEMod fleet breakdowns have been used to calculate CAP emissions for comparison with the BAAQMD construction thresholds of significance.

Abbreviations:

ARB - California Air Resources Board
bhp - brake horsepower
CalEEMod® - California Emissions Estimator Model
CAP - criteria air pollutants
CO - carbon monoxide
CO_2 - carbon dioxide
DEIR- Draft Environmental Impact Report
EMFAC - Emissions Factor
FTE - Full time equivalent
HO - half offset
hr - hour
mpg - miles per gallon
NEVES - Nonroad Engine and Vehicle Emission Study
NO_X - nitrogen oxides
PM_{10} - particulate matter under 10 microns
$PM_{2.5}$ - particulate matter under 2.5 microns
PSSI - Peninsula Sanitary Service, Inc.
ROG - reactive organic gas
SO_X - sulfur oxide
TBD - To be determined
ton - short tons
USEPA - United States Environmental Protection Agency
VMT - vehicle miles traveled
yr - year

Notes:

1. List of campus-wide emergency generators along with their BAAQMD ID, year, engine rating, and diesel particulate filter abatement is provided by Stanford for 2015. There are four generators smaller than 50 hp that are exempt from permitting; they are conservatively assumed to be 50 hp each for emission calculations.
2. 2015 is based on actual non-emergency and emergency run hours in 2015. For Fall 2018, it is assumed that the number of generators will increase proportional to the increase in academic square footage (8%); however, since the size and type of generator is unknown, Ramboll assumed an 8% increase in total emissions. This same methodology was used to represent the increase in academic square footage from Fall 2018 to the buildout of the 2018 GUP (an additional 22% increase). Since the Alternatives do not result in increased academic building space, no change is assumed from the Project to the Alternatives.
3. Lists the source for the NOx, CO, POC and PM_{10} emission factor. 'BAAQMD Spec' refers to BAAQMD Specification Sheets for certain generators which was provided by Stanford. 'Exec Order' refers to ARB Executive Order which is available via the ARB Off-road Certification database. 'AP-42' refers to the USEPA compilation of air pollutant emission factors. 'Tier Std' refers to the ARB/USEPA Tier Standards .
4. SO_2 emission factor for all the emergency generators was calculated using 0.0015 weight percent sulfur and the emission factor provided in Table 3.4-1 from AP-42. The % sulfur in fuel oil was assumed to be 15 ppm, based on diesel fuel sulfur content from California Diesel Fuel Regulation.

Abbreviations:

AP 42 - USEPA compilation of air pollutant emission factors
ARB - California Air Resources Board
BAAQMD - Bay Area Air Quality Management District
BAAQMD Spec - BAAQMD Specification Sheets
bhp - brake horsepower
CAP - criteria air pollutants
CO - carbon monoxide
Exec Order - ARB Executive Order
FO - full offset
g - gram
HO - half offset
hp - horsepower
hr - hour
ID - identification
NO_X - nitrogen oxides
PM_{10} - particulate matter under 10 micron diameter
POC - precursor organic compound
ppm - parts per million
SO_2 - sulfur dioxide
Tier Std - ARB/USEPA Tier Standards
ton - short tons
US EPA - United States Environmental Protection Agency
yr - year

Table 3-9
TAC and ROG Emissions - Laboratories
Stanford University
Stanford, California

Change from DEIR Fall 2035 analysis

Chemical	CAS-number	Representative Lab Estimated Usage[1] [lbs/year]	Fume Hoods in Representative Lab[2]	Fume Hoods on Campus with Chemical (Fall 2018)[2]	Scaling for Fall 2035[3]	Fume Hoods on Campus with Chemical (Fall 2035)[3]	Emission Factor[4]	TAC Emissions[5,6] [lbs/year]	ROG Emissions[5,7] [lbs/year]
Vinyl chloride	75-01-4	132	164	236	22%	288	100%	232	232
Xylenes	1330-20-7	0,496	164	1,176	22%	1,436	5%	217	217
Zinc and compounds	7440-66-6	625	164	1,071	22%	1,308	1%	50	0
Total for Fall 2035, FO Alternative, and HO Alternative								**180,525**	**37,503**

Notes:

1. Baseline usage is from Stanford's laboratory chemical inventories. Data is used when available from a Stanford 2001 inventory for the ChemBio building, then the Lokey Laboratory, then the Shriram Center, the Mudd (Seeley G) Chemistry, and the Environment and Energy buildings.

   Assumption: Estimated Usage = Inventory Quantity x 1.1 for archival chemicals (ethylene dibromide and hexachlorobenzene)
   Estimated Usage = Inventory Quantity x 1.1 x 12 for all other chemicals

2. The quantity of chemicals used in Fall 2018 is assumed to scale linearly with the number of fume hoods in each laboratory as shown in DEIR Appendix AQ Table 3-4-14. The exception to this assumption is for isopropanol and acetone where the emissions are assumed to scale by wet laboratory square footage.

3. Scaling for Fall 2035 is based on the increase in academic square footage expected from Fall 2018 to full buildout of the 2018 GUP, with the assumption that the increase in laboratory space is proportional to the increase in overall academic space. Increased residential housing from the proposed Alternatives will not impact laboratory emissions, so these remain unchanged from Project emissions.

4. Emission factors represent what percentage of the mass usage of the chemical is emitted into the air. made the following assumptions:

   Emission Factor for Gases = 100%
   Emission Factor for Liquids = 5%
   Emission Factor for Solids/Metals = 1%
   Emission Factor for Methylene Chloride = 20%

5. Emissions are calculated by the representative lab estimated usage normalized by fume hoods, multiplied by total fume hoods on campus with the chemical, then multiplied by the emission factor.

6. TACs include those regulated by BAAQMD Regulation 2-5, chemicals frequently used in laboratory operations, and chemicals evaluated in past studies and health risk assessments.

7. ROGs are identified by ARB. Available at: http://www.arb.ca.gov/ei/speciate/voc_rog_dfn_1_09.pdf

Abbreviations:

ARB - California Air Resources Board
BAAQMD - Bay Area Air Quality Management District
CAS - Chemical Abstracts Service
DEIR - Draft Environmental Impact Report
HO - half offset
lb - pound
ROG - reactive organic gas
TAC - toxic air contaminants

Table 3-10
ROG Emissions - Fuel Station
Stanford University
Stanford, CA

Change from DEIR Fall 2035 analysis

Source	Fall 2018 Maximum Gasoline Annual Throughput[1]	Scaling Factor for Increase in Electric Vehicles in the Campus Fleet[2]	Fall 2035, FO, and HO Alternative Maximum Gasoline Annual Throughput[1]	Emission Factor	Emissions
				VOC[3]	VOC
	[gal/yr]	[%]	[gal/yr]	[lb/1000 gal]	[ton/yr]
Bonair	140,288	-50%	70,144	1.06	3.7E-02
			Total for Fall 2035, FO Alternative, and HO Alternative [ton/yr]		**3.7E-02**

Notes:

1. Fall 2018 gasoline annual throughput is shown in DEIR Appendix AQT Table 3-4-18.
2. By Fall 2035, 70% of campus fleet is expected to be electric; 40% was electric by Fall 2018, so the 2018 fuel consumption was assumed to represent the emissions for the 60% of the campus fleet that use internal combustion engines. Therefore, the fuel usage was scaled down by (1-40%)/(1-70%) since the remaining vehicles are assumed to use electricity. No change is assumed for the Alternatives.
3. Controlled VOC emission factors (EF) are obtained from the source specific guidance section for the petroleum industry from BAAQMD's Permit Handbook. Controlled baseline EF is estimated by multiplying the uncontrolled baseline EF by the percent of the emissions which would not be controlled by a fully functional Phase II system. Uncontrolled VOC emissions are due to tank filling, vehicle fueling, and minor spillage.

   Equation Used:

   Controlled VOC EF = 21.2 lb/1000 gal of gasoline * (1.00 - 0.95)

Abbreviations:

BAAQMD - Bay Area Air Quality Management District
DEIR- Draft Environmental Impact Report
EF - emission factors
FO - full offset
gal - gallon
HO - half offset
GUP - general use permit
lb - pound
ton - short tons
ROG - reactive organic gas
VOC - volatile organic compounds
yr - year

Change from DEIR Fall 2035 analysis

Equipment	Fall 2018 Annual Natural Gas Usage[1]	Scaling for FO Alternative[2]	FO Alternative Annual Natural Gas Usage	Emission Factors[3]			Emissions		
				Benzene	Formaldehyde	Toluene	Benzene	Formaldehyde	Toluene
	[MMBtu/yr]	[%]	[MMBtu]	[lb/MMBtu]	[lb/MMBtu]	[lb/MMBtu]	[lb/yr]	[lb/yr]	[lb/yr]
Hot Water Generators	109,605	22%	133,845	2.1E-06	7.4E-05	3.3E-06	0.28	9.8	0.45
Replacement Process Steam Plant	89,021	22%	108,709				0.22	8.0	0.36
Other Natural Gas - Total	379,172		504,682				1.04	37	1.7
PGE Residential	58,626	39%	81,637				0.17	6.0	0.27
PGE Commercial - Individual Replacement Boilers[4]	11,007	0%	11,007				0.023	0.81	0.037
PGE Commercial - Remaining[4]	308,198	22%	376,358				0.77	28	1.3
PGE Searsville/Olmstead Housing[5]	1,341	0%	1,341				0.0028	0.10	0.0045
PGE New Faculty/Staff Housing[6]	0	N/A	34,339				0.0707	2.52	0.1145

Notes:

1. Fall 2018 Annual Natural Gas usage details are shown in DEIR Appendix AQT Table 4-1-4.
2. Scaling for FO Alternative is primarily based on the increase in academic square footage and student beds expected from Fall 2018 to full buildout of the 2018 GUP, including the increase in housing for this Alternative. The majority of PGE Residential addresses are student housing, so the increase is based on number of beds. PGE Commercial, the Hot Water Generators, and the Replacement Process Steam Plant serve largely academic buildings, so the increase is based on academic square footage. Estimates for new faculty/staff housing are added. The six individual replacement boilers are not expected to increase in use. Gas use is assumed to scale linearly; i.e., efficiency and use in new buildings is assumed equal to current buildings. This is likely very conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to result in lower natural gas usage in new buildings.
3. Benzene, formaldehyde and toluene are the only TACs evaluated by the BAAQMD for natural gas combustion from boilers. Emission factors were taken from the BAAQMD Permit Handbook, Section 2.1, Miscellaneous Natural Gas Combustion. http://hank.baaqmd.gov/pmt/handbook/rev02/PH_00_05_02_01.pdf
4. The six individual replacement boilers are not expected to increase in gas consumption. Based on matching up PGE commercial addresses, Ramboll estimated the gas consumption from these boilers and separated this from the total PGE commercial gas. Not all boilers addresses could be matched, and not all gas used at a given address is necessarily due to the boilers, so this breakdown is approximate.
5. Areas on campus for which Stanford did not provide detailed gas data include the Searsville Block and Olmsted Staff faculty/staff housing. The annual gas use is based on the CalEEMod® version 2013.2.2 default for single family homes built to 2008 Title 24 standards in climate zone 4.
6. This represents the natural gas consumption from the 2,892 new faculty/staff high density homes to be constructed within the study boundary under this alternative. The annual natural gas use is based on the CalEEMod® version 2013.2.2 default for condo/townhouse built to 2008 Title 24 standards in climate zone 4, adjusted to an approximation of 2016 Title 24 standards (effective January 1, 2017). This is likely very conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to require residences to achieve higher efficiency with each code cycle.

Total Emissions from Mobile Sources (ton/year)												**0.25**	**0.042**	**1.03**

Table 4-3
FO Alternative TAC Emissions - Mobile Use
Stanford University
Stanford, CA

Notes:

1. Trip information is provided by Fehr & Peers or derived using data from the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. Greyed out cells are either not needed for this analysis (e.g., off-road equipment trips per year) or irrelevant because the assumptions are already embedded into the VMT analysis (e.g., trip lengths for workers).
2. Benzene and 1,3-butadiene speciation percentages for gasoline exhaust and evaporative are from BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards 2011, Table 14 (http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20Modeling%20Approach.ashx?la=en), and for diesel exhaust from MOVES 2007. Gasoline is speciated from TOG emissions and diesel is speciated from ROG emissions. DPM is equivalent to PM10 emissions (see Mobile CAPs tab) for diesel vehicles. For Benzene, gasoline exhaust speciation percentage of 2.47% is used, gasoline evaporative speciation percentage of 0.36% is used, and diesel speciation percentage of 1.29% is used. For 1,3-Butadiene, gasoline speciation percentage of 0.55% is used and diesel speciation percentage of 0.08% is used. Benzene and 1,3-butadiene account for 92% of the cancer risk from all toxic compounds listed in the speciation of TOG due to Tailpipe Emissions, shown in Table 14 offrom the BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (2011) Table 14: Toxic Speciation of TOG due to Tailpipe Emissions. Therefore, so only those two compounds are included for gasoline TAC calculations.
3. EMFAC emission factors used for calculating on-road emissions are summarized in DEIR Appendix AQT Appendix C.
4. Number of vehicles and trips per vehicle are used to estimate starting and idling emissions. The number of vehicles for residents is based on parking permits. For workers and other trips types, number of vehicles is based on trips per year divided by commuting or driving to campus days per year. Trip counts for worker and resident trips, visitors, and vendors are provided by Fehr & Peers in the SB 743 Analysis. Trip count for shuttles/buses is provided by Stanford. Bonair, PSSI, and Public Safety trip counts are calculated from total vehicle trips and number of vehicles in the fleet. Total vehicle trips per year calculated from total VMT divided by the trip length or provided by Fehr & Peers.
5. VMT per year for the FO Alternative inventory based on data provided by Fehr & Peers.
6. The vehicle fleet is comprised of 99% gasoline-powered vehicles so only a gasoline speciation was used for these entries and chemicals from non-gasoline vehicles were assumed to be negligible.
7. VMT for on-road campus vehicles is split into four categories: Bonair, Marguerite, PSSI, and Public Safety. Bonair vehicles are separated by fuel type and vehicle weight class and uses gallons of fuel used with the EMFAC mpg for that vehicle class in Santa Clara county to estimate VMT. Diesel fuel usage, number of vehicles, and trip rate/length was obtained from Stanford and used to estimate PSSI vehicle emissions. Stanford indicated that their on-campus fleet will incorporate higher percentages of electric vehicles over time. The on-campus fleet for the 2018 inventory was estimated to be 40% electric and is expected to be 70% electric by 2035. Since emissions for the 2018 inventory were based on fueling data (no data on electric vehicles), emissions from on-campus vehicles for 2035 are estimated by scaling assuming only 30% non-electric vehicles contribute to emissions in 2035 versus 60% in 2018. This scaling is done in the "Total Emissions" column. Additionally, Stanford expects the entire Marguerite fleet to be electric by 2035. Fuel usage and number of vehicles in the fleet were provided by Stanford for public safety vehicles; these are assumed to be a fleet of light duty vehicles.
8. EMFAC2014 mpg is calculated by summing the VMT for specific weight classes and dividing by the fuel consumption. Emission factors are shown in DEIR Appendix AQT Appendix C.
9. Marguerite buses are assumed to all be electric by 2035. By Fall 2018, assumed that the Bonair fleet, by switching from a "service yard" system to a "hub" system, will see a 5% reduction in VMT from Bonair vehicles; this is kept constant through 2035.
10. Off-road equipment emission factors for smaller gasoline equipment are from CalEEMod® Table 7.2 under category "Other Lawn and Garden Equipment." Emission factors for light towers are from CalEEMod® Table 3.4 under category "Generator Sets" and emission factors from diesel off-road equipment are from CalEEMod® Table 3.4 under category "Other General Industrial Equipment" for equipment between 6-50 HP.
11. Conversion factors from fuel usage to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES).
12. Bhp-hr per year for Siebel and Red Barn off-road equipment is estimated from fuel consumption using a conversion factor (for gas and diesel) to convert from gallons to bhp-hr.
13. Vendor and Hauling VMT are based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction. This consists of 37 trips per day, 7.3 miles per trip for the 230 day building construction phase each year for vendor trips, and 7,987 trips per year, 20 miles per trip for haul trips. Additional vendor and hauling trips added for the FO Alternative construction consist of 14 vendor trips/day for 220 days and 10,369 trips/year for haul trucks. These VMT and emissions are a sub-category of the 'Other Trips - Trucks' VMT because these trips would be counted in the Fehr & Peers cordon reconciliation analysis and because the primary vehicle type would be medium- and heavy-duty vehicles. Because over 90% of MHDT and HHDT trucks are diesel in the EMFAC2014 fleet, the diesel emission factors for the overall "Trucks" category are used here.

Abbreviations:

ARB - California Air Resources Board
bhp - brake horsepower
CalEEMod® - California Emission Estimator Model
CAP - criteria air pollutants
DEIR - Draft Environmental Impact Report
DPM - diesel particulate matter
EMFAC - emissions factors
FTE - full-time equivalent
GUP - General Use Permit
HO - half offset
hp - horsepower
hr - hour
mpg - miles per gallon
NEVES - Nonroad Engine and Vehicle Emission Study
PM_{10} - particulate matter less than 10 microns in diameter
PSSI - Peninsula Sanitary Service, Inc.
ROG - reactive organic gas
TAC - toxic air contaminants
TOG - total organic gases
ton - short tons
USEPA - United States Environmental Protection Agency
VMT - vehicle miles travelled
yr - year

Table 4-4
HO Alternative TAC Emissions - Mobile Use
Stanford University
Stanford, CA

Notes:

1. Trip information is provided by Fehr & Peers or derived using data from the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. Greyed out cells are either not needed for this analysis (e.g., off-road equipment trips per year) or irrelevant because the assumptions are already embedded into the VMT analysis (e.g., trip lengths for workers).
2. Benzene and 1,3-butadiene speciation percentages for gasoline exhaust and evaporative are from BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards 2011, Table 14 (http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20Modeling%20Approach.ashx?la=en), and for diesel exhaust from MOVES 2007. Gasoline is speciated from TOG emissions and diesel is speciated from ROG emissions. DPM is equivalent to PM10 emissions (see Mobile CAPs tab) for diesel vehicles. For Benzene, gasoline exhaust speciation percentage of 2.47% is used, gasoline evaporative speciation percentage of 0.36% is used, and diesel speciation percentage of 1.29% is used. For 1,3-Butadiene, gasoline speciation percentage of 0.55% is used and diesel speciation percentage of 0.08% is used. Benzene and 1,3-butadiene account for 92% of the cancer risk from all toxic compounds listed in the speciation of TOG due to Tailpipe Emissions, shown in Table 14 offrom the BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (2011) Table 14: Toxic Speciation of TOG due to Tailpipe Emissions. Therefore, so only those two compounds are included for gasoline TAC calculations.
3. EMFAC emission factors used for calculating on-road emissions are summarized in DEIR Appendix AQT Appendix C.
4. Number of vehicles and trips per vehicle are used to estimate starting and idling emissions. The number of vehicles for residents is based on parking permits. For workers and other trips types, number of vehicles is based on trips per year divided by commuting or driving to campus days per year. Trip counts for worker and resident trips, visitors, and vendors are provided by Fehr & Peers in the SB 743 Analysis. Trip count for shuttles/buses is provided by Stanford. Bonair, PSSI, and Public Safety trip counts are calculated from total vehicle trips and number of vehicles in the fleet. Total vehicle trips per year calculated from total VMT divided by the trip length or provided by Fehr & Peers.
5. VMT per year for the HO Alternative inventory based on data provided by Fehr & Peers.
6. The vehicle fleet is comprised of 99% gasoline-powered vehicles so only a gasoline speciation was used for these entries and chemicals from non-gasoline vehicles were assumed to be negligible.
7. VMT for on-road campus vehicles is split into four categories: Bonair, Marguerite, PSSI, and Public Safety. Bonair vehicles are separated by fuel type and vehicle weight class and uses gallons of fuel used with the EMFAC mpg for that vehicle class in Santa Clara county to estimate VMT. Diesel fuel usage, number of vehicles, and trip rate/length was obtained from Stanford and used to estimate PSSI vehicle emissions. Stanford indicated that their on-campus fleet will incorporate higher percentages of electric vehicles over time. The on-campus fleet for the 2018 inventory was estimated to be 40% electric and is expected to be 70% electric by 2035. Since emissions for the 2018 inventory were based on fueling data (no data on electric vehicles), emissions from on-campus vehicles for 2035 are estimated by scaling assuming only 30% non-electric vehicles contribute to emissions in 2035 versus 60% in 2018. This scaling is done in the "Total Emissions" column. Additionally, Stanford expects the entire Marguerite fleet to be electric by 2035. Fuel usage and number of vehicles in the fleet were provided by Stanford for public safety vehicles; these are assumed to be a fleet of light duty vehicles.
8. EMFAC2014 mpg is calculated by summing the VMT for specific weight classes and dividing by the fuel consumption. Emission factors are shown in DEIR Appendix AQT Appendix C.
9. Marguerite buses are assumed to all be electric by 2035. By Fall 2018, assumed that the Bonair fleet, by switching from a "service yard" system to a "hub" system, will see a 5% reduction in VMT from Bonair vehicles; this is kept constant through 2035.
10. Off-road equipment emission factors for smaller gasoline equipment are from CalEEMod® Table 7.2 under category "Other Lawn and Garden Equipment." Emission factors for light towers are from CalEEMod® Table 3.4 under category "Generator Sets" and emission factors from diesel off-road equipment are from CalEEMod® Table 3.4 under category "Other General Industrial Equipment" for equipment between 6-50 HP.
11. Conversion factors from fuel usage to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES).
12. Bhp-hr per year for Siebel and Red Barn off-road equipment is estimated from fuel consumption using a conversion factor (for gas and diesel) to convert from gallons to bhp-hr.
13. Vendor and Hauling VMT are based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction. This consists of 37 trips per day, 7.3 miles per trip for the 230 day building construction phase each year for vendor trips, and 7,987 trips per year, 20 miles per trip for haul trips. Additional vendor and hauling trips added for the HO Alternative construction consist of 7 vendor trips/day for 220 days and 5,184 trips/year for haul trucks. These VMT and emissions are a sub-category of the 'Other Trips - Trucks' VMT because these trips would be counted in the Fehr & Peers cordon reconciliation analysis and because the primary vehicle type would be medium- and heavy-duty vehicles. Because over 90% of MHDT and HHDT trucks are diesel in the EMFAC2014 fleet, the diesel emission factors for the overall "Trucks" category are used here.

Abbreviations:

ARB - California Air Resources Board
bhp - brake horsepower
CalEEMod® - California Emission Estimator Model
CAP - criteria air pollutants
DEIR - Draft Environmental Impact Report
DPM - diesel particulate matter
EMFAC - emissions factors
FTE - full-time equivalent
GUP - General Use Permit
HO - half offset
hp - horsepower
hr - hour
mpg - miles per gallon
NEVES - Nonroad Engine and Vehicle Emission Study
PM_{10} - particulate matter less than 10 microns in diameter
PSSI - Peninsula Sanitary Service, Inc.
ROG - reactive organic gas
TAC - toxic air contaminants
TOG - total organic gases
ton - short tons
USEPA - United States Environmental Protection Agency
VMT - vehicle miles travelled
yr - year

Notes:

1. Fall 2035 represents full buildout of the Project. Mobile emission factors are conservatively used from year 2030, to be consistent with the GHG report and comparison to State 2030 targets.
2. The FO and HO Alternatives inventories include emissions changes due to additional graduate student beds and faculty/staff housing compared to the Project.
3. For the Project inventory, construction emissions are estimated using CalEEMod® 2013.2.2 using the average annual square footage of construction and demolition and estimated excavation from fiscal year 2001 through fiscal year 2015 with default construction schedules and equipment lists. For the Alternatives inventories, construction emissions are added for the annual average number of additional dwelling units. For all inventories, construction equipment is all assumed to meet Final Tier 4 standards, except for chainsaws and paving phase equipment. Construction on-road emissions (worker, vendor, and hauling trips) are included in the mobile sources.

Abbreviations:

CalEEMod® - California Emission Estimator Model
DPM - diesel particulate matter
FO - full offset
GHG - greenhouse gas
HO - half offset
PGE - Pacific Gas & Electric
PM_{10} - particulate matter under 10 microns in diameter
TAC - toxic air contaminants
ton - short tons
yr - year

Stanford Construction/Demolition, HO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	67.00	Dwelling Unit	1.05	67,000.00	192

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2018
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - HO Alternative average construction

Construction Phase - Changed start year for construction to 2018. Made schedule fit in 1 year

Trips and VMT - Offroad only.

Demolition - Expected demolition for the HO Alternative

Grading - Average annual excavation for the HO alternative

Architectural Coating -

Vehicle Trips - Not modeling operational emissions

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - Not modeling operational emissions

Area Coating - Not modeling operational emissions

Landscape Equipment - Not modeling operational emissions

Energy Use - Not modeling operational emissions

Water And Wastewater - Not modeling operational emissions

Solid Waste - Not modeling operational emissions

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido.

Mobile Land Use Mitigation - Not modeling operational emissions

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation - Not modeling operational emissions

Water Mitigation - Not modeling operational emissions

Waste Mitigation - Not modeling operational emissions

Stanford Construction/Demolition, FO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	135.00	Dwelling Unit	2.11	135,000.00	386

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2030
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - Additional construction for alternative

Construction Phase - Changed start year for construction to 2030. Made schedule fit in 1 year

Trips and VMT - Off-road only

Demolition - Expected demolition according to FO alternative

Grading -

Architectural Coating -

Vehicle Trips - not modeling operation here

Vechicle Emission Factors - Not modeling operational emissions

Vechicle Emission Factors - Not modeling operational emissions

Vechicle Emission Factors - Not modeling operational emissions

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - not modeling operations

Area Coating - not modeling operation

Landscape Equipment - not modeling operation

Energy Use - not modeling operation

Water And Wastewater - not modeling operation

Solid Waste - not modeling operation

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation -

Water Mitigation - Not modeling operational emissions

Stanford Construction/Demolition, HO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	67.00	Dwelling Unit	1.05	67,000.00	192

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2030
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - HO Alternative average construction

Construction Phase - Changed start year for construction to 2030. Made schedule fit in 1 year

Trips and VMT - Offroad only.

Demolition - Expected demolition for the HO Alternative

Grading - Average annual excavation for the HO alternative

Architectural Coating -

Vehicle Trips - Not modeling operational emissions

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - Not modeling operational emissions

Area Coating - Not modeling operational emissions

Landscape Equipment - Not modeling operational emissions

Energy Use - Not modeling operational emissions

Water And Wastewater - Not modeling operational emissions

Solid Waste - Not modeling operational emissions

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido

Mobile Land Use Mitigation - Not modeling operational emissions

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation - Not modeling operational emissions

Water Mitigation - Not modeling operational emissions

Waste Mitigation - Not modeling operational emissions

Operational Off-Road Equipment - Not modeling operations

memorandum

date	April 19, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Chris Sanchez- ESA
subject	**ESA Peer Review of Air Quality Technical Analysis for Housing Alternatives**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Energy Technical Analysis for Housing Alternatives*, dated April 6, 2018, prepared by Ramboll for Stanford.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated its memo accordingly. The memo was revised by Stanford on April 19, 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Energy Technical Analysis for Housing Alternatives* memo is appropriate for use as reference in the EIR.

RAMBOLL

MEMO

Client	**Stanford University**
Date	**April 19, 2018**
To	**Catherine Palter, Stanford University** **Lesley Lowe, Stanford University**
From	**Ramboll**
Subject	**2018 General Use Permit EIR: Energy Technical Analysis for Housing Alternatives**

1. Introduction

The County of Santa Clara (the "County") has chosen to study two alternatives in response to comments on the 2018 Stanford General Use Permit (GUP) Draft EIR (DEIR). This memorandum summarizes the energy technical analyses for these alternatives.

1.1 Description of Alternatives

The County has chosen to study two alternatives in response to housing comments on the DEIR. These alternatives are:

- *Full Offset Housing Alternative (Alternative FO):* Adds to the proposed project **2,549** additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of **5,699** net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- *Half Offset Housing Alternative (Alternative HO):* Adds to the proposed project **1,275** additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of **4,425** net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

1.2 Analysis Years

This report evaluates the potential energy impacts of the proposed Alternatives with particular emphasis on avoiding or reducing inefficient, wasteful, or unnecessary consumption of energy. Inventories of existing conditions for the following years of operation can be found in DEIR Appendix ENE: 2014, 2015, and annualized emissions for Fall 2018. An estimate for Fall 2020 operations is presented in the DEIR to show the additional consumption due to the new Escondido Village graduate housing. Estimates for the Alternatives for buildout year of 2035 follow the same methodologies as for the Project and are presented in this report.

Date April 19, 2018

San Francisco, CA 94111
USA

T +1 415 796 1950
F +1 415 398 5812
www.ramboll.com

Study area boundaries for the two Alternatives are the same as for the Project. Details regarding the boundaries can be found in DEIR Appendix ENE Section 1.2.1.

2. Energy Environmental and Regulatory Overview

Energy environmental and regulatory overview remain unchanged since the publishing of the DEIR. Information on environmental and regulatory conditions can be found in DEIR Appendix ENE Section 2.

3. Existing Conditions and Alternatives

This section describes the methodology that Ramboll used to develop the Alternatives energy inventories. Full details on the calculation methodology for the existing conditions and Project inventories are provided in DEIR Appendix ENE.

3.1 Stanford Energy

3.1.1 Electricity

For the Fall 2035 Alternatives energy inventories, electricity usage is based on Fall 2020 usage estimates scaled up to account for development by 2035. Electricity usage from the additional faculty/staff high density homes and the additional graduate housing to be constructed within the study boundary by 2035 was added to the Project inventory. Consistent with the DEIR methodology, the annual electricity use is based on the CalEEMod® default for condo/townhouse built to 2008 Title 24 standards in climate zone 4, adjusted to an approximation of 2016 Title 24 standards (effective January 1, 2017). This energy consumption is likely conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to require residences to achieve higher efficiency with each code cycle. Total electricity use for 2035 was estimated to be 406,389 MWh for Alternative FO and 401,873 MWh for Alternative HO.

3.1.2 Natural Gas

Natural gas is imported for both residential and commercial usage (e.g., cooking and heating) and industrial usage. For the Alternatives inventories, the only deviations from the Project natural gas usage result from additional gas consumption for the PGE Residential and PGE New Faculty/Staff Housing subcategories due to increased residential housing. The additional graduate student natural gas use is scaled up by number of new beds, consistent with the DEIR methodology. New private faculty/staff housing natural gas usage is based on averages for the climate zone assuming compliance with the 2016 Title 24 Building Energy Efficiency Standards, consistent with the usage assumptions for the proposed Project housing in the DEIR. All other subcategories remain the same as the Project.

Natural gas usage for 2035 was estimated to be 747,236 MMBtu for Alternative FO and 732,841 MMBtu for Alternative HO.

3.2 Mobile Fuel

Fuel usage was estimated from on-road VMT by residents, workers, visitors, and delivery vehicles visiting the various land use types at Stanford. Activity data (number of trips and/or VMT) for off-campus trips, on-campus trips, and vendors were provided by Fehr & Peers. Methodology for estimating fuel usage for the Alternatives remains unchanged from Project methodology in the DEIR, and additional explanation of these methods can be found in DEIR Appendix ENE Section 3.2.

Data from Fehr & Peers is provided in the **2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis**. Fuel usage was estimated using an average miles per

gallon (mpg) obtained from EMFAC2014[1] for the fleet mix corresponding to the vehicle category and fuel type (gasoline or diesel). **Table 3-1** provides more detail on vehicle fuel usage estimates.

Mobile fuel usage was estimated at the totals shown in **Table 3-2** below.

Table 3-2. Mobile Fuel Totals

	Mobile Fuel Usage (gallons/year)	
Inventory Year	**Gasoline**	**Diesel**
Fall 2035 (Project)	4,259,978	163,216
Fall 2035 (Alternative FO)	5,032,004	204,583
Fall 2035 (Alternative HO)	4,649,313	183,925

Fuel usage in the DEIR was estimated to incrementally decrease from beginning to end of the Project due to increased fuel efficiency, an increase in electric vehicles in the statewide fleet, Stanford's commitment to replacing campus shuttles and vehicles with electric vehicles, and alternative transportation programs that incentivize alternative transportation besides single commuter trips, reducing the VMT in diesel or gasoline vehicles. Due to the increased VMT of the Alternatives, fuel totals are expected to be 18% more for Alternative FO and 9% more for Alternative HO than for the Project.

3.3 Diesel Fuel (Emergency Generators)

Increased residential housing from the proposed Alternatives will not impact emergency generator fuel usage, so these remain unchanged from Project usage presented in the DEIR. **Table 3-3** presents emergency generator fuel usage for Alternatives FO and HO.

3.4 Construction Equipment & Activities

Increased residential housing under the Alternatives contribute to increased construction activities compared to the Project. To evaluate this increase, construction fuel total from the incremental increase in housing development was added to Project construction fuel totals. Methodology for estimate fuel totals from construction activities remains unchanged from the DEIR, additional information on these methods can be found in DEIR Appendix ENE Section 3.4.

Worker, vendor, and hauling trips from construction are included in mobile fuel estimates in **Section 3.2**. A summary of fuel usage from off-road construction equipment and on-road worker, vendor, and hauling trips is shown in **Table 3-4**. Off-road fuel calculation details are shown in DEIR Appendix ENE Table 3-4-2 for the Project construction equipment. **Tables 3-5** and **3-6** show off-road fuel calculations for the additional construction equipment used for the FO Alternative and HO Alternative, respectively, based on the CalEEMod® runs included in GHG Memo Appendix A. On-road fuel use is shown in **Table 3-1**.

[1] A newer version of this database, EMFAC2017, was officially released on December 22, 2017, after the publishing of the DEIR. To maintain consistency with DEIR methods and allow for side-by-side comparisons across Project scenarios and Alternatives, the same database as used in the DEIR, EMFAC2014, was used in this Alternatives analysis. In addition, EMFAC2017 has not yet been approved by the USEPA.

Table 3-4. Construction Fuel Totals		
	Construction Fuel Usage (gallons/year)	
Inventory Year	Gasoline	Diesel
Fall 2035 (Project)	138,338	71,892
Fall 2035 (Alternative FO)	145,071	133,362
Fall 2035 (Alternative HO)	141,462	110,280

4. Impact Assessment and Mitigation Measures

While no quantitative thresholds related to energy are included in CEQA Guidelines Appendix G, please refer to DEIR Appendix ENE Section 4.1 for a description of Part I of Appendix F of the CEQA Guidelines. The methodology used to evaluate the significance of the Alternatives energy-related impacts is explained in the context of each impact, as discussed below.

4.1 Environmental Analysis

Impact ER-1a: Alternative FO Would Not Result in the Wasteful, Inefficient or Unnecessary Consumption of Fuel or Energy, and Conversely the Project Would Incorporate Renewable Energy and Energy Efficiency Measures into Building Design, Equipment Use, Transportation or Other Project Features. ***(Less than Significant without Mitigation.)***

Impact ER-1b: Alternative HO Would Not Result in the Wasteful, Inefficient or Unnecessary Consumption of Fuel or Energy, and Conversely the Project Would Incorporate Renewable Energy and Energy Efficiency Measures into Building Design, Equipment Use, Transportation or Other Project Features. ***(Less than Significant without Mitigation.)***

4.1.1 Overview

As described in detail in DEIR Appendix ENE Section 4.3.1, Stanford has prepared an Energy and Climate Plan that includes goals for high performance building design and energy conservation in existing buildings. Stanford has made great efforts to be one of the most energy-efficient universities in the world. In 2015, Stanford completed a groundbreaking overhaul of its campus heating and cooling system (SESI). SESI relies on a heat-recovery process that is 70 percent more efficient than the prior cogeneration process for heating and cooling. The new system will meet more than 90 percent of the campus heating demands by capturing almost two-thirds of the waste heat generated by the campus cooling system. Stanford now purchases its electricity through a Direct Access program that enables purchase from Electric Service Providers that include renewable resources within their portfolios. At the end of 2016, the Stanford Solar Generating Station in Kern County also began operations. In addition, solar panels have been added, as feasible, to buildings throughout the campus.

4.1.1.1 Electricity

Alternative FO would increase electricity demand by approximately 9,035 MWh per year compared to the Project, although per service population electricity demand would decrease slightly, as shown in **Table 4-1**. Electricity demand per service population was estimated to decrease with Alternative FO, from 5.8 MWh per year per service population for the Fall 2035 Project to 5.4 MWh per year per service population in Fall 2035 FO Alternative. Electricity demand per service population for the Alternatives also decreased relative to the Baseline, which was 6.0 MWh per year per service population in Fall 2018.

Alternative HO would increase electricity demand by approximately 4,520 MWh per year, although per service population electricity demand would decrease slightly, as shown in **Table 4-1**. Electricity demand per service population was estimated to decrease with Alternative HO, from 5.8 MWh per year per service population for the Fall 2035 Project to 5.6 MWh per year per service population in Fall 2035 HO Alternative.

Table 4-1. Electricity Consumption per Service Population

Inventory Year	Electricity Consumption (MWh)	Service Population	Electricity per Service Population (MWh/person)
Fall 2035 (Project)	397,353	68,781	5.8
Fall 2035 (Alternative FO)	406,389	75,078	5.4
Fall 2035 (Alternative HO)	401,873	71,930	5.6

4.1.1.2 Natural Gas

Table 4-2 shows energy consumption for the Fall 2035 Project and Alternatives inventory years. The Alternatives would result in more energy consumption than the Project but slightly lower energy consumption per service population than the Project. Similarly, the Alternatives would result in more energy consumption than the Baseline but lower energy consumption per service population.

Table 4-2. Building Energy Consumption per Service Population

Inventory Year	Natural Gas Consumption (MMBtu)	Electricity Consumption (MMBtu equivalent)	Building Energy Consumption Total (MMBtu)	Service Population	Building Energy Consumption per Service Population (MMBtu/person)
Fall 2035 (Project)	718,441	1,355,769	2,074,210	68,781	30.2
Fall 2035 (Alternative FO)	747,236	1,386,598	2,133,834	75,078	28.4
Fall 2035 (Alternative HO)	732,841	1,371,190	2,104,031	71,930	29.3

Alternative FO would increase natural gas demand by approximately 28,795 MMBtu per year compared to the Project, but per service population natural gas demand would slightly decrease compared to the Project, as shown in **Table 4-3**. Natural gas demand for Alternative FO would decrease from 10.4 MMBtu per year per service population in Fall 2035 Project to 10.0 MMBtu per year per service population. Alternative FO would result in more natural gas consumption than the Baseline but lower natural gas consumption per service population.

Alternative HO would increase natural gas demand by approximately 14,400 MMBtu per year compared to the Project, but per service population natural gas demand would slightly decrease compared to the Project, as shown in **Table 4-3**. Natural gas demand for Alternative HO would decrease from 10.4 MMBtu per year per service population for Fall 2035 Project to 10.2 MMBtu per year per service population. Alternative HO would result in more natural gas consumption than the Baseline but lower natural gas consumption per service population.

Estimated energy demand for Stanford assumes new buildings are constructed to the same energy intensity as existing buildings, excluding Faculty/Staff housing which estimates usage using 2016 Title 24 Standards. This is likely a conservative estimate, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to result in lower natural gas usage in new buildings. Furthermore, Stanford's whole-building targets will promote increased efficiency in each new building constructed on the campus and are expected to result in even lower natural gas usage in new buildings.

Table 4-3. Natural Gas Consumption per Service Population

Inventory Year	Natural Gas Consumption (MMBtu)	Service Population	Natural Gas per Service Population
Fall 2035 (Project)	718,441	68,781	10.4
Fall 2035 (Alternative FO)	747,236	75,078	10.0
Fall 2035 (Alternative HO)	732,841	71,930	10.2

4.1.1.3 Transportation Fuel

As described in detail in DEIR Appendix ENE Section 4.3.2, Stanford will decrease transportation fuel use by incorporating more electric vehicles into the on-campus fleet, providing on-site charging stations to support the expanded use of electric vehicles by students, staff and visitors, and continuing to implement alternative transportation programs.

As described further in the **2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis**, the VMT generation for Stanford's workers and residents are both substantially lower than the regionwide and countywide average VMT for those populations. The primary reasons the VMT is so low are the Travel Demand Management (TDM) program and the ability for residents to commute to work or class without using personal vehicles due to the density of public transit near and on the campus. In addition, the availability of on-campus housing for students and faculty also reduces VMT from commuting. Lower VMT results in lower mobile fuel use per worker and per resident than the regionwide and countywide average. These conclusions remain true for the HO and FO Alternatives.

Additional information regarding fuel use and mobile impacts can be found in the **Greenhouse Gas and Air Quality Alternatives Memos** as well as the **SB 743 VMT Analysis**.

4.2 Analysis of Factors Identified in CEQA Guidelines Appendix F

To determine whether a project would result in the wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely whether the project would fail to incorporate renewable energy or energy efficiency measures into building design, equipment use,

transportation or other project features, Appendix F of the CEQA Guidelines identifies six categories of potential energy-related environmental impacts, and five categories of potential mitigation measures that may be incorporated into the project. Each impact and mitigation category identified in Appendix F is addressed below in the same context as in the DEIR Appendix ENE Section 4.3.3.

Based on the analysis of each of these factors, the potential for the Alternatives to result in wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely to fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features is **less than significant.**

4.2.1 Appendix F.II.C.1 Energy Requirements and Energy Use Efficiencies

In section II.C.1, CEQA Guidelines Appendix F states that environmental impacts may include:

The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.

The Alternatives inventories prepared for this evaluation include energy and fuel used for construction and operation of the Stanford campus, including maintenance of campus facilities and demolition activities. Energy intensiveness of materials is not addressed because the California Governor's Office of Planning and Research has explained that "a full 'lifecycle' analysis that would account for energy in building materials and consumer products will generally not be required." See OPR, Proposed Updates to the CEQA Guidelines (Preliminary Discussion Draft, Aug.11, 2015), at pp. 77-78. Such an analysis runs a substantial risk of double counting energy use and associated greenhouse gas emissions.

Sections 3.3 and 3.4 above discuss the Alternatives energy use requirements in detail, including electricity, natural gas, mobile fuel, diesel fuel for emergency generators, and construction equipment and activities. These energy use requirements are summarized in **Table 4-4** below for operational activities and in **Table 4-5** for construction activities. As construction activities occur annually, they are also included in the operational table.

Table 4-4. Operational Energy Use Requirements

Inventory Year	Electricity (MWh)	Natural Gas (MMBtu)	Mobile Fuel (gallons)[1]		Diesel Fuel (Off-Road Construction)[2] (gallons)	Diesel Fuel (Emergency Generators) (gallons)
			Gasoline	Diesel		
Fall 2018 (Baseline)	320,952	577,799	5,433,619	456,762	37,700	36,271
Fall 2035 (Project)	397,353	718,441	4,259,978	163,216	37,700	44,293
Fall 2035 (Alternative FO)	406,389	747,236	5,032,004	204,583	64,036	44,293
Fall 2035 (Alternative HO)	401,873	732,841	4,649,313	183,925	58,525	44,293

Notes:

[1] Mobile fuel includes fuel for on-road construction worker, vendor, and hauling vehicles.

[2] Off-road fuel efficiency is assumed to remain constant for the different calendar years. Therefore, off-road fuel use from construction activity is the same across the Baseline and Project years, which have the same amount of average construction activity. Additional fuel use is added for the additional construction under the Alternatives.

Table 4-5. Construction Energy Use Requirements

Inventory Year	Construction Equipment & Activities (gallons)	
	Gasoline	Diesel
Fall 2018 (Baseline)	232,027	76,431
Fall 2035 (Project)	138,338	71,892
Fall 2035 (Alternative FO)	145,071	133,362
Fall 2035 (Alternative HO)	141,462	110,280

To demonstrate how these energy use totals compare between the 2018 Baseline and 2035 Project and Alternatives years, total energy use requirements have been converted to MMBtu equivalents and resulting MMBtu per service population metrics are presented in **Table 4-6** below.

Table 4-6. Total Energy Use Requirements, MMBtu per Service Population			
Inventory Year	**MMBtu Equivalents**	**Service Population**	**MMBtu/ Service Population**
Fall 2018 (Baseline)	2,420,428	53,268	45.4
Fall 2035 (Project)	2,636,532	68,781	38.3
Fall 2035 (Alternative FO)	2,801,297	75,078	37.3
Fall 2035 (Alternative HO)	2,720,403	71,930	37.8

As shown in the tables above, the FO and HO Alternatives use more energy than the Project. The total energy use for both Alternatives is greater than that for the Fall 2018 Baseline. However, both Alternatives use less energy per service population than the Fall 2018 Baseline or the Project.

4.2.2 Appendix F.II.C.2 Local and Regional Energy Supplies

In section II.C.2, CEQA Guidelines Appendix F states that environmental impacts may include:

The effects of the project on local and regional energy supplies and on requirements for additional capacity.

Alternatives FO and HO will not have a substantial impact on the local or regional energy supplies or require additional capacity to be constructed. As described in the DEIR Appendix ENE Section 4.3.3.2, through use of renewable energy, energy efficiency standards, and the new CEF, Stanford will minimize impacts on the local and regional energy supply.

As shown and discussed in **Section 3** above, Stanford relies on electricity, natural gas, and gasoline and diesel consumption associated with mobile operations, emergency generator operations, and construction operations. Total energy use requirements for Fall 2018 Baseline and Fall 2035 Project and Alternatives years are summarized in **Tables 4-4** and **4-5** above.

To put Stanford's energy use in context, in 2015, Californians consumed 282,896 GWh of electricity, of which Santa Clara County consumed 16,812 GWh.[2] Total in-state generation, not including small-scale solar installations, was 196,195 GWh, and energy imports accounted for 34% of the state-wide power mix.[3] CEC estimates that state-wide energy demand will increase to 322,266 GWh in 2025 with an average annual growth rate of 1.27%.[4] The anticipated increases in electricity usage of 85,437 MWh/yr from the 2018 Baseline to the FO Alternative by 2035 reflects an average annual increase of 1.48% electricity usage. The anticipated increases in electricity usage of 85,437 MWh/yr from the 2018 Baseline to the HO Alternative by 2035 reflects an average annual increase of 1.40% electricity usage. These are both consistent with the state-wide annual growth rate of 1.27%. Stanford electricity use projections are also within range of regional estimates for the Greater Bay Area. The CEC

[3] California Energy Commission. 2016. Total Electricity System Power. Available online at: http://www.energy.ca.gov/almanac/electricity_data/total_system_power.html.

[4] California Energy Commission. 2016. California Energy Demand Updated Forecast, 2017-2027. Available online at: http://docketpublic.energy.ca.gov/PublicDocuments/16-IEPR-05/TN214635_20161205T142341_California_Energy_Demand_Updated_Forecast.pdf

projects a mid-range rate of 1.16% annual consumption growth, with a high estimate of 1.61%.[5] Overall, the projected electricity growth under both Alternatives is consistent with state and regional projections. Therefore, University Alternatives will not require additional generation capacity beyond more general state-wide expansion.

Stanford's annual natural gas consumption is estimated to increase by 169,437 MMBtu by 2035 for the FO Alternative and 155,042 MMBtu by 2035 for the HO Alternative. In 2035, campus natural gas consumption will reach 747,236 MMBtu/yr for the FO Alternative and 732,841 MMBTU/yr for the HO Alternative, about half of Stanford building consumption in 2014. As described earlier, this is based on scaling up current building natural gas usage and is therefore a conservative estimate. In comparison, it is projected that California natural gas demand will decrease in 2030 to 2,160,800 MMscf/yr, or 2,230 trillion Btu/yr.[6] Stanford's natural gas consumption accounts for less than 0.05% of the projected statewide annual consumption.

Although natural gas is the most common electricity source in California, 90% of the state's natural gas is imported from the Rocky Mountain region, the Southwest, and Canadian basins.[7] The United States produces 20 trillion scf/yr and had 340 trillion scf of proven reserves in 2014.[8] Stanford's natural gas consumption is not substantial in comparison to the national natural gas reserves and comprises only 0.003% of annual national natural gas production.

Gasoline and diesel are provided by California's transportation fuels supplier network, as the majority of gasoline and diesel fuels are used for transportation to and from the Stanford Campus.

Overall, Alternatives FO and HO will not have a substantial impact on the local or regional energy supplies or require additional capacity to be constructed.

4.2.3 Appendix F.II.C.3 Peak and Base Period Demands

In section II.C.3, CEQA Guidelines Appendix F states that environmental impacts may include:

The effects of the project on peak and base period demands for electricity and other forms of energy.

Alternatives FO and HO will not have a substantial impact on the peak and base period demands for electricity or other forms of energy. Further details and reasoning are described below and in the DEIR Appendix ENE.

As discussed in Stanford's Energy and Climate Plan[9], the Stanford Energy System Innovations (SESI) program was designed to increase Stanford's energy efficiency and allow the CEF to meet both peak and base demand. DEIR Appendix ENE Section 3.1 discusses features of the new CEF in further detail, but specific aspects of the energy system allow for renewable or

sustainable options for meeting peak demand. Thermal energy storage, for example, allows for flexibility to run equipment at optimal load settings.

Stanford's procurement of substantial amounts of renewable energy, including the new 73 MW off-site solar PV plant in southern California and the 4.9 MW of on-site rooftop solar PV, will also help the University meet peak demands. Specifically, the off-site solar PV plant will meet the University's peak electricity demands of 42 MW.[10]

As of the end of 2016, 65 percent of Stanford's electricity was generated from renewable sources.[11] This extensive generation of new renewable energy reduces the strain on electricity production by reducing the demand for electricity generation from the grid resources, particularly during peak times when energy demand is the highest and solar energy potential is also the highest.

In 2016, California's peak grid demand was 46,193 MW. On the same day, PG&E reached a maximum demand of 23,752 MW.[12] In comparison, Stanford University's maximum demand in 2016 was 45 MW. With the implementation of new model-predictive control software at Stanford's CEF, maximum demand is expected to decrease to 38 MW in 2017. The model-predictive-control software used at the CEF is a software system developed and patented by Stanford that optimizes cost and energy efficiency through predicting hourly campus heating, cooling, and grid electricity prices 10 days in advance. This is then used to determine when to use electricity to operate plant heating and cooling equipment as well as how much hot and cold water to store in the thermal storage tanks.[13]

With the proposed Project, Stanford's peak demand is forecasted to increase to 48 MW by 2035. It is not expected that the demand from additional housing associated with the Alternatives will significantly change this peak, as the Stanford electricity peak demand historically takes place mid-day, when residents would generally not be home. This is similar to peak demand in 2016. The University will have a relatively negligible effect on state-wide peak demands, which will be further lessened by its Kern County solar plant.

4.2.4 Appendix F.II.C.4 Existing Energy Standards

In section II.C.4, CEQA Guidelines Appendix F states that environmental impacts may include:

The degree to which the project complies with existing energy standards.

Stanford complies with existing energy standards. During implementation of the Alternatives, Stanford will continue to adhere to State standards designed to minimize use of fuel in construction vehicles, ensure that buildings employ strict energy efficiency techniques, and operate comprehensive transportation demand management programs, as described further in the DEIR Appendix ENE. It is not expected that construction or operation of the Alternatives would change compliance with these standards or implementation of programs.

---

[10] According to the Stanford Sustainability and Energy Management Department, during commissioning of the new energy system the peak electrical demand varied by month and reached a maximum of 45 MW in 2016. After commissioning was complete and the new model predictive control energy management software was fully enabled for 2017, the expected peak electrical demand on the grid will be approximately 38 MW for calendar year 2017. The University's long term forecast is that the University's peak electrical demand in 2035 will be 48 MW.

4.2.5 Appendix F.II.C.5 Energy Resources

In section II.C.5, CEQA Guidelines Appendix F states that environmental impacts may include:

The effects of the project on energy resources.

Stanford's use of energy for the Alternatives will not have a substantial effect on statewide or regional energy resources. Stanford's energy use is discussed in Section 3 above, including electricity, natural gas, and gasoline and diesel consumption associated with mobile operations, emergency generator operations, and construction operations. Total energy use requirements for Fall 2018 Baseline, Fall 2035 Project, and Fall 2035 Alternatives years are summarized in **Tables 4-4** and **4-5** above.

Programs and measures relevant to energy resources are discussed in detail in DEIR Appendix ENE Section 4.3.

4.2.6 Appendix F.II.C.6 Transportation Energy Use

In section II.C.6, CEQA Guidelines Appendix F states that environmental impacts may include:

The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

Stanford uses efficient transportation alternatives to reduce its transportation energy use requirements, as described further below.

Stanford's transportation energy use is discussed in **Section 3** above and gasoline and diesel quantities for Fall 2018 Baseline, Fall 2035 Project and Fall 2035 Alternatives, are presented in **Table 3-2**. The quantification of VMT associated with Stanford operations, which feeds into total transportation energy use quantified, is discussed in detail in the **SB 743 VMT Analysis**.

As described further in the **SB 743 VMT Analysis**, the VMT generation for Stanford's workers and residents are substantially lower than the regionwide and countywide average VMT for those populations, for the Project and the Alternatives. The primary reasons the VMT at Stanford is so low are due to the TDM program and the ability for residents to commute to work or class without using personal vehicles due to the density of public transit near and on the campus. The TDM program is described further in the DEIR Appendix ENE, and it is not expected the construction or operation of the additional housing in the Alternatives would impact this program. In addition, on-campus housing for faculty and students lowers commuting VMT. Lower VMT results in lower mobile fuel use per worker and per resident than the regionwide and countywide average.

4.2.7 Appendix F.II.D.1 Energy Reduction Measures

In section II.D.1, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

Potential measures to reduce wasteful, inefficient and unnecessary consumption of energy during construction, operation, maintenance and/or removal. The discussion should explain why certain measures were incorporated in the project and why other measures were dismissed.

Stanford implements a number of ongoing programs to reduce the consumption of energy, as described in the DEIR Appendix ENE. Existing programs such as use of the new Central Energy Facility, procurement of solar power from Stanford's offsite Kern County facility and travel demand management, reasonably can be expected to continue given Stanford's investment in its ongoing capital improvements and programs. New measures, such as conversion of Marguerite shuttles and campus fleets to electric vehicles, are identified in the project

description that Stanford submitted with its application. It is not expected the construction or operation of the additional housing in the Alternatives would impact these measures.

4.2.8 Appendix F.II.D.2 Siting, Orientation, and Design

In section II.D.2, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

The potential of siting, orientation, and design to minimize energy consumption, including transportation energy, increase water conservation and reduce solid waste.

A number of Stanford initiatives and programs, as well as general features of the campus itself, utilize siting, orientation, or design elements to minimize energy consumption, as discussed further in the DEIR Appendix ENE. It is not expected the construction or operation of the additional housing in the Alternatives would affect these initiatives or features.

4.2.9 Appendix F.II.D.3 Reducing Peak Energy Demand

In section II.D.3, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

The potential for reducing peak energy demand.

Stanford's new energy system, combined with use of renewable energy, help reduce the University's peak energy demand, and will continue to do so throughout the Project life. This is discussed further in DEIR Appendix ENE. It is not expected the construction or operation of the additional housing in the Alternatives would significantly impact the energy system.

4.2.10 Appendix F.II.D.4 Alternative Fuels

In section II.D.4, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

Alternative fuels (particularly renewable ones) or energy systems.

Stanford has pursued the use of alternative fuels or energy systems for heating, cooling, electricity, and transportation, as discussed in the DEIR Appendix ENE. It is not expected the construction or operation of the additional housing in the Alternatives would significantly impact the use of alternative fuels or energy systems.

4.2.11 Appendix F.II.D.5 Recycling Efforts

In section II.D.5, CEQA Guidelines Appendix F states that mitigation measures (including those already incorporated into the project) may include:

Energy conservation which could result from recycling efforts.

California has a statewide goal of 75% waste diversion by 2020; thus, Stanford has implemented several policies in order to achieve that goal. These are described further in DEIR Appendix ENE. It is not expected the construction or operation of the additional housing in the Alternatives would significantly impact the recycling efforts.

In sum, based on the analysis of each of the factors identified in CEQA Guidelines Appendix F, the potential for the Alternatives to result in wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely to fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features is **less than significant**.

TABLES

Table 3-1
Mobile Fuel Consumption
Stanford University
Stanford, CA

Change from DEIR Fall 2035 analysis

Year	Mobile Category	Quantity Provided (VMT or fuel)	Unit	Percent Gasoline Vehicle Miles[7]	Gasoline Miles per Gallon	Percent Diesel Vehicle Miles[7]	Diesel Miles per Gallon	Fuel Consumption (gallons of gasoline)	Fuel Consumption (gallons of diesel)
Fall 2035[6]	Worker + Resident[1]	132,334,620	VMT	90.2%	40	0.9%	50	2,958,507	24,095
	Construction Worker[1]	6,148,856	VMT	90.2%	40	0.9%	50	137,465	1,120

							Total Gallons	**4,649,313**	**183,925**

Notes:

1. Vehicle miles travelled provided by Fehr & Peers in the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. EMFAC fuel economy for the specified fleet mix and inventory year was used to estimate fuel consumption.
2. For Public Safety fleet, Stanford provided raw data of fuel consumption from non-University sources (the remainder of fuel is included in the "Bonair" category for fuel obtained from the on-campus Bonair fueling station). Stanford also provided annual fuel consumption for the Valero fuel station. The 'Off Road' category includes fuel for off-road equipment serviced by the Bonair fueling station and fuel for the golf course equipment.
3. Vendor VMT is based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction and additional construction for the Alternatives. This consists of 37 trips per day for the Project plus 14 trips per day for the FO Alternative of 7 trips per day for the HO Alternative, 7.3 miles per trip for the 230 day building construction phase each year, with a 50/50 split of medium- and heavy-duty trucks. This VMT was subtracted from the 'Other Trips' VMT because these trips would be counted in the Fehr & Peers analysis.
4. Hauling VMT is based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average demolition and excavation quantities for the Project and Alternatives. This consists of 7,987 total trips for the Project plus 10,369 trips for the FO Alternative or 5,184 trips for the HO Alternative of 20 miles each, all heavy-heavy duty vehicles. This VMT was subtracted from the 'Other Trips' VMT because these trips would be counted in the Fehr & Peers analysis.
5. For Marguerite fleet, Stanford provided vehicle miles travelled. Mileage was used to estimate fuel consumption using EMFAC fuel economy for the specified fleet mix and inventory year. For Bonair and PSSI fleets, Stanford provided fuel usage. Bonair and Marguerite fleets incorporate more electric vehicles over time (with Marguerite fully electric by Fall 2035). For the Marguerite fleet, fuel usage will decrease over time due to the increased number of electric vehicles in the fleet but this fleet turnover will not affect VMT, so VMT is scaled up based on academic square footage. Diesel fuel usage is set to zero in Fall 2035 because all Marguerite buses are assumed to be electric by then. For the Bonair fleet, fuel usage was adjusted to reflect decrease in fuel usage due to electric vehicles being incorporated into the fleet.
6. Miles per gallon calculated from the fuel consumption and vehicle miles travelled using 2030 as the inventory year in the EMFAC database. The 2030 emissions inventory is used to allow for conservative comparisons of project buildout with adopted 2030 regulatory measures. Only vehicle types within the specified mobile category fleet mix were used for calculating fuel economy.
7. Percentage of gasoline or diesel vehicle miles calculated by taking the ratio of vehicle miles driven by a specific fuel-type vehicle over total miles for that vehicle classification (for all fuel types) in EMFAC.

FO - Full Offset
gal - gallon
HO - Half Offset
PS – Public Safety
PSSI – Peninsula Sanitary Service, Inc.
VMT - Vehicle miles travelled

Table 3-3
Generator Fuel Consumption
Stanford University
Stanford, CA

Year	Generator Hours of Operation (hrs)	Fuel Consumption[1] (gallons of diesel)
Fall 2035, FO Alternative, and HO Alternative[2]	1,276	44,293

Notes:

1. Fuel consumption rate information was not available for all units. Therefore, fuel consumption shown here was estimated assuming 34.7 gal/hr from a representative engine (Cummins, QSX15-G9 NR 2, @ 1800 RPM) with a horsepower (HP) of 755.
2. It is assumed that the hours of operation will increase proportional to the increase in academic square footage over Fall 2018 (approximately 22%) and would not change for the HO or FO Alternatives. Fall 2018 hours of operation are shown in DEIR Appendix ENE. Fuel consumption estimates are based on full project buildout.

	Pavers	4,200		215
	Paving Equipment	3,744		191
	Rollers	4,864		248
	Tractors/Loaders/Backhoes	2,871		147
Architectural Coating	Air Compressors	2,246		115
Total	-	-	-	**26,336**

Notes:

1. Equipment use is based on CalEEMod® 2013.2.2 model runs for the additional annual average construction activity for the Alternative. The construction schedule, off-road equipment lists and equipment specifications are CalEEMod® defaults for the construction of an annual average of 135 condo/townhouse dwelling units, demolition of 3,539 sqft of buildings, and excavation of 82,821 cubic yards of soil per year, with the schedules set such that all construction occurs within one year. Methodology is described further in the GHG Housing Alternatives Memo, and CalEEMod® output files are provided in the GHG Housing Alternatives Memo, Appendix A.

2. Conversion factors from fuel usage to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES). Off-road equipment fuel efficiency is assumed to remain constant for the different calendar years. Therefore, off-road fuel use from construction activity is the same across inventory years.

memorandum

date	April 19, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Chris Sanchez, Jeff Caton- ESA
subject	**ESA Peer Review of GHG Technical Analysis for Housing Alternatives**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: GHG Technical Analysis for Housing Alternatives*, dated April 6, 2018, prepared by Ramboll for Stanford.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated its memo accordingly. The memo was revised by Stanford on April 19, 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: GHG Technical Analysis for Housing Alternatives* memo is appropriate for use as reference in the EIR.

1. Introduction

The County of Santa Clara (the "County") has chosen to study two alternatives in response to comments on the 2018 Stanford General Use Permit (GUP) Draft EIR (DEIR). This memorandum summarizes the greenhouse gas technical analyses for these alternatives.

1.1 Description of Alternatives

The County has chosen to study two alternatives in response to housing comments on the DEIR. These alternatives are:

- *Full Offset Housing Alternative (Alternative FO):* Adds to the proposed project **2,549** additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of **5,699** net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- *Half Offset Housing Alternative (Alternative HO):* Adds to the proposed project **1,275** additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of **4,425** net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

1.2 Emissions Inventory Years

This report evaluates the greenhouse gas (GHG) emissions inventories associated with the buildings and energy sources for the development proposed under Alternative FO and Alternative HO for the 2018 GUP. Inventories of existing conditions can be found in DEIR Appendix GHG Sections 3 and 4. Inventories presented here represent emissions for the completion of the development proposed for Alternative FO and Alternative HO, anticipated to occur by Fall 2035.

This memo evaluates the emissions inventories for complete buildout of Alternative FO and Alternative HO. Because California has adopted a regulatory goal for reductions in GHG emissions by 2030, the Project

and Alternatives emissions inventories are based on adopted regulatory measures (e.g., RPS) and emission factors (e.g., EMFAC2014 mobile factors), assuming the total operational activity from complete buildout and operation of the 2018 GUP in 2030. Complete buildout is called "Fall 2035" because it consists of the full operations of each of the Alternatives. However, the mobile source emissions are conservatively calculated using 2030 emission factors, consistent with the DEIR.[1] If 2035 mobile source emission factors were used instead of 2030, the total GHG emissions would be lower than reported here. Therefore, this comparison is a conservative estimate of the anticipated 2035 Alternatives emissions. This report also includes an estimate of Alternatives emissions in Fall 2035 that incorporates intensity factors for electricity generation consistent with expected implementation of renewable portfolio standards in 2035. The additional scenario is labeled "Fall 2035 With RPS Projection".

Study area boundaries for the two Alternatives are the same as for the Project. Details regarding the boundaries can be found in DEIR Appendix GHG Section 1.2.1.

2. GHG Scientific Background and Regulatory Overview

Greenhouse gas scientific background and regulatory overview remain unchanged since the publishing of the DEIR, except that the "Proposed 2030 Target Scoping Plan" discussed therein has since been finalized. On December 14, 2017, CARB adopted California's 2017 Climate Change Scoping Plan (Second Update).[2] This update identifies CARB's strategy for achieving the state's 2030 GHG target as established in SB 32 (discussed in the DEIR Appendix GHG Section 2).The strategy includes continuation of the Cap-and-Trade Program through 2030, and incorporates a Mobile Source Strategy that includes strategies targeted to increase zero emission vehicle fleet penetration and a more stringent target for the Low Carbon Fuel Standard by 2030. Information on environmental and regulatory conditions can be found in DEIR Appendix GHG Section 2.

3. GHG Emissions Inventory

This section describes the methodology that Ramboll used to develop the Alternatives GHG emission inventories, which include both construction and operational emissions. GHG operational emissions sources within the study area at Stanford University include: electricity use, natural gas use, mobile sources, emergency generator use, solid waste, and water supply and wastewater. Full details on the calculation methodology for the existing conditions and Project inventories are provided in DEIR Appendix GHG Appendix A.

As discussed in DEIR Appendix GHG Section 2.1, the term "GHGs" includes gases from fossil fuel use that contribute to the global greenhouse effect, such as CO_2, CH_4, and N_2O, as well as gases that are only man-made and that are emitted through the use of modern industrial products, such as HFCs and CFCs. Water, although a GHG, is not typically evaluated, as water vapor is ubiquitous and typically considered in the context of global feedback loops rather than as an emission from a single project. GHG emissions are typically measured in terms of mass of CO_2e. In this report, a tonne refers to metric ton (MT) (1,000 kilograms). Additionally, exact totals presented in all tables and report sections may not equal the sum of components due to independent rounding of numbers. Additional details on the units of measure can be found in DEIR Appendix GHG Section 3.1.

---

[1] 2030 mobile source emission factors are used to be consistent in comparison with the 2030 GHG emissions threshold.

[2] CARB. 2017. California's 2017 Climate Change Scoping Plan. November. Available at: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf.

3.1 Existing Conditions Inventories

The DEIR presented three scenario years to evaluate existing conditions: 2014, 2015, and Fall 2018, and one scenario to evaluate conditions at full buildout of the 2000 GUP: Fall 2020. Existing conditions inventories and methodologies remain unchanged from the DEIR, further detail on these inventories can be found in DEIR Appendix GHG Section 3 and 4.

3.2 Alternatives Inventories

This memo evaluates the emissions inventory for complete buildout of Alternative FO and Alternative HO of the 2018 GUP. The Fall 2020 emissions inventory was scaled up to develop the Alternatives inventories by incorporating assumptions on growth in certain categories, such as an increase in residential beds. Because California has adopted goals for reducing GHGs by 2030, the Project emissions inventory is based on adopted regulatory measures (e.g., RPS) and emission factors (e.g., EMFAC2014 mobile factors), assuming the total operational activity from complete buildout and operation of the 2018 GUP in 2030.[3] This scenario consists of the full Alternatives operations which are expected by 2035. This report also includes an estimate of Alternatives emissions in Fall 2035 that incorporates intensity factors for electricity generation consistent with expected implementation of renewable portfolio standards in 2035. The additional scenario is labeled "Fall 2035 With RPS Projection". A comparison of the Alternatives inventories, and the additional Fall 2035 scenario, to the Project inventory is presented in **Table 3-1.**

3.3 Construction Emissions – Alternatives

This section describes the estimation of GHG emissions from construction activities within the study area. Average annual construction and demolition square footage from fiscal year 2001 through fiscal year 2015 were used to estimate the annual emissions from construction and demolition for all existing conditions and Project inventory years. Detailed information on the construction emissions calculations and methodologies are provided in DEIR Appendix GHG Section 3.3, and detailed emission inventory from the California Emissions Estimator Model (CalEEMod®) output files are included in DEIR Appendix GHG Appendix B.

To evaluate construction emissions for Alternative FO and Alternative HO, emissions from the additional proposed housing was estimated using CalEEMod® version 2013.2.2.[4] The number of additional units added to the proposed project under each Alternative was input into CalEEMod® by the average number of dwelling units constructed per year in order to calculate average annual emissions. The average number of dwelling units per year is based on the total number of additional units and the number of years until full buildout.

Estimates of the amount of excavation and demolition for the additional proposed housing units under both Alternatives were made based on scaling factors derived from the construction of the Escondido Village Graduate Residences (EVGR). Assuming future housing will be constructed with similar density and space needs, both excavation and demolition quantities for the Alternatives were calculated based on the annual average number of proposed dwelling units, assuming the same ratio of excavation and demolition per dwelling unit as EVGR.

---

[3] A newer version of this database, EMFAC2017, was officially released on December 22, 2017, after the publishing of the DEIR. To maintain consistency with DEIR methods and allow for side-by-side comparisons across Project scenarios and Alternatives, the same database as used in the DEIR, EMFAC2014, was used in this Alternatives analysis. In addition, EMFAC2017 has not yet been approved by the USEPA.

[4] Two more recent versions of CalEEMod® have now been released (versions 2016.3.1 and 2016.3.2). However, version 2013.2.2 was used to be consistent with the DEIR analyses.

The resulting annual emissions from CalEEMod® for each Alternative were added to the Project annual construction emissions to evaluate impacts. CalEEMod® outputs are shown in Appendix A. Consistent with the DEIR, all construction equipment is assumed to meet Final Tier 4 standards, except for chainsaws and paving phase equipment. Emissions for each Alternative are shown in **Table 3-1** and detailed mobile source tables.

3.3.1 Vegetation Changes

Permanent vegetation changes that occur as a result of land use development constitute a one-time change in the carbon sequestration capacity of a project site. In this case, no construction is proposed in open space areas, and redevelopment will primarily occur in the core campus and parking lots and will be landscaped with trees. This will result in an overall negligible change in carbon sequestration once the vegetation reaches a steady state (i.e., new vegetation replaces dying vegetation). Consequently, vegetation change results in a negligible change in GHG emissions for these Alternatives.

3.4 Indirect GHG Emissions from Electricity Use

Indirect GHG emissions, which occur when electricity is used, are typically due to electricity generation from offsite power plant locations. Electrical power is supplied to the study area by PGE.

To estimate emissions, the electricity usage is multiplied by the emission intensity factors for the GHGs. Emission intensity factors are GHG emission rates from a given source in terms of the amount of GHG released (lbs) per MWh of energy produced.

Stanford purchases "direct access" electricity for a portion of its operations. Additional information on service providers and electricity intensity factors for the existing conditions inventories can be found in DEIR Appendix GHG Section 3.5. Alternatives electricity intensity factors are the same as for the Project, based on the assumption that PGE and WECC California achieve the State's SB 350 goal of acquiring 50 percent of energy from renewable sources in 2030.[5] The electricity intensity factor for the Fall 2035 with RPS Projection inventory is derived based on a linear trajectory for electricity to meet California's 2050 GHG goal of 80% below 1990 levels, assuming the State will similarly achieve 80% RPS by 2050. This is consistent with the CARB 2017 Climate Change Scoping Plan[6], and results in in 57.5% of electricity from renewables by 2035. The default electricity intensity for CH_4 and N_2O were obtained from CalEEMod® Appendix D value for PGE and were conservatively not adjusted for future inventory years. A summary of the electricity intensity factors is shown in the DEIR Appendix GHG Table 3-5-1.

3.5 Operational Emissions – Alternatives

Existing conditions inventories (2014, 2015, and Fall 2018) remain unchanged from the DEIR. Further detail on these inventories can be found in DEIR Appendix GHG Section 3.6. This section describes methodologies for calculating the Fall 2035 inventories for Alternative FO and Alternative HO.

3.5.1 Electricity

For the Alternatives and Alternatives with RPS Projection inventories, electricity emissions are based on Fall 2020 usage estimates scaled up to account for development by 2035. Electricity

[5] CEC. 2016. Clean Energy & Pollution Reduction Act SB 350 Overview. Available at: http://www.energy.ca.gov/sb350/. Accessed: October 2016.

[6] CARB. 2017. 2017 Scoping Plan, Appendix D: PATHWAYS, pg 12 (November). Available at: https://www.arb.ca.gov/cc/scopingplan/2030sp_appd_pathways_final.pdf

usage from the additional faculty/staff high density homes and the additional graduate housing to be constructed within the study boundary by 2035 was also added to the inventory. Consistent with the DEIR methodology, the annual electricity use is based on the CalEEMod® default for condo/townhouse built to 2008 Title 24 standards in climate zone 4, adjusted to an approximation of 2016 Title 24 standards (effective January 1, 2017). This energy consumption is likely conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to require residences to achieve higher efficiency with each code cycle. This additional predicted increase in electricity consumption (which is likely overestimated due to using older Title 24 efficiency predictions) is assumed to incorporate any increase in electrical demand for charging electric vehicles. Alternatives electricity intensity factors are consistent with the Project inventory.

Electricity consumption and emissions for both 2035 and 2035 with RPS inventories for Alternatives FO and HO are summarized in **Tables 3-2a, 3-2b, 3-3a and 3-3b**, respectively.

3.5.2 Natural Gas

GHG emissions from natural gas combustion are generated from residential and commercial usage (e.g., cooking and heating) and industrial usage. For the Alternatives inventories, the only deviations from the Project emissions result from additional gas consumption for the PGE Residential and PGE New Faculty/Staff Housing subcategories due to increased residential housing. The additional graduate student natural gas use is scaled up by number of new beds, consistent with the DEIR methodology. New private faculty/staff housing natural gas usage is based on averages for the climate zone assuming compliance with the 2016 Title 24 Building Energy Efficiency Standards, consistent with the usage assumptions for the proposed Project housing in the DEIR. All other subcategories remain the same as the Project.

GHG emissions are calculated based on CO_2, CH_4, and N_2O emission factors (on a per therm basis) from the Federal Mandatory GHG Reporting Regulation (40 CFR 98).

Natural gas consumption, emission factors, and emissions for both Alternatives are summarized in **Tables 3-4** and **3-5.**

3.5.3 Mobile Sources

GHG emissions associated with on-road mobile sources are generated from residents, workers, visitors, and delivery vehicles visiting the various land use types at Stanford. Mobile source emissions include running exhaust emissions and starting exhaust tailpipe emissions. Running exhaust is dependent on VMT. Starting exhaust is dependent on the number of starts or trips that a vehicle makes. EMFAC2014 was used to calculate the emission factors for each type of fleet in the relevant operational year. Assumptions and calculations used to determine these values are described in detail in DEIR Appendix GHG Appendix C. Methodologies for estimating GHG emissions from mobile sources remains unchanged from the DEIR.

Increased housing from the two proposed Alternatives cause changes in mobile activity data. Updated activity data for Fall 2035 Alternatives (number of trips and/or VMT) for off-campus trips, on-campus trips, and construction trucks were provided by Fehr & Peers. Data from Fehr & Peers is provided in **2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis**. The same mobile source GHG emission factors were used as in the DEIR. Full calculation details can be found in DEIR Appendix GHG Appendix A. Mobile emissions for Alternative FO can be found in **Table 3-6** and for Alternative HO in **Table 3-7**.

3.5.4 Emergency Generators

Increased residential housing from the proposed Alternatives will not impact emergency generator emissions, so these remain unchanged from Project emissions presented in the DEIR. **Table 3-8** presents emergency generator emissions for Alternatives FO and HO.

3.5.5 Waste

Indirect GHG emissions associated with waste disposal include CH_4 generation from the decomposition of waste and the CO_2 emissions associated with the combustion of CH_4, if applicable. For 2035, waste generated due to the increased housing for the proposed Alternatives was estimated in the same way as was estimated for the proposed Project new faculty/staff housing. Waste generated by the new residents is based on the 2015 waste generated by Stanford faculty/staff housing. The diversion rate is assumed to remain the same as the 2015 rate, even though diversion rate statewide is expected to increase by 2035.

GHG emissions associated with non-landfill diverted waste streams are not considered, because it is generally assumed that these diversions do not result in any appreciable amounts of GHG emissions when operated effectively.[7] These waste diversion alternatives may result in differences in life-cycle emissions of GHGs, but it is not appropriate to combine life-cycle emissions for only one category of emissions.[8] Biogenic CO_2 emissions were not included when ARB analyzed the GHG emissions inventory under AB 32. Therefore, they are not included in the emissions inventory.

Emissions are summarized for Alternative FO in **Table 3-9** and for Alternative HO in **Table 3-10**.

3.5.6 Water Use and Emissions

Indirect GHG emissions result from the production of electricity used to convey, treat, and distribute water and wastewater. The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of the water. Stanford potable water is sourced from the San Francisco Public Utilities Commission. Non-potable water comes from groundwater and lake water. Additional emissions from wastewater treatment include CH_4 and N_2O, which are emitted directly from the wastewater.

Water use rates are not expected to change from the Project on a per bed or per dwelling unit basis. The additional graduate student beds and faculty/staff housing units are incorporated to determine the increase in water use totals for the Alternatives. Emissions are summarized for the 2035 and 2035 with RPS Projection inventories for Alternative FO in **Tables 3-11a and 3-11b** and for Alternative HO in **Tables 3-12a and 3-12b**.

3.5.7 Miscellaneous GHG Sources

In addition to the main inventory items described above, miscellaneous GHG sources were also added based on Stanford Office of Sustainability estimates for propane and acetylene combustion as well as the HFCs used in fire suppression. These emissions are not expected to change due to the Alternatives. Emissions are shown in **Table 3-1**.

---

[7] ARB. 2010. Local Government Operations Protocol. Chapter 9.4.

[8] This inventory represents scope 1 and 2 emission categories. A life-cycle analysis of waste diversion would be a scope 3 inventory. CARB's Local Government Operations Protocol Version 1.1 (May 2010) clearly states that scope 3 emissions should not be combined with scope 1 and 2 emissions.

3.6 GHG Alternatives Inventories in Context

A category-by-category comparison of emissions between the Project inventory and the two Alternatives is shown in **Table 3-1**. Due to the increases in building energy use and traffic, total mass emissions of GHGs increase for the HO and FO Alternatives compared to the Project.

A summary of total emissions for each inventory is shown in **Table 3-13 and Figure 3-6** and a summary of the GHG emissions per service population metric for each inventory is shown in **Figure 3-7**. Alternative FO increases GHG emissions by 9% compared to the Project and 10% compared to the Project with RPS Projection inventories. Alternative HO increases GHG emissions by 5% compared to the Project and Project with RPS Projection inventories.

Table 3-13. Stanford GHG Emissions

Inventory Year	GHG Emissions (MT CO_2e/yr)
2018 (Baseline)	125,672
2035 (Project)	125,412
2035 (Alternative FO)	137,295
2035 (Alternative HO)	131,472
2035 (Project) with RPS Projection	119,875
2035 (Alternative FO) with RPS Projection	131,555
2035 (Alternative HO) with RPS Projection	125,833

Figure 3-6. Stanford GHG Emissions for Project and Alternatives

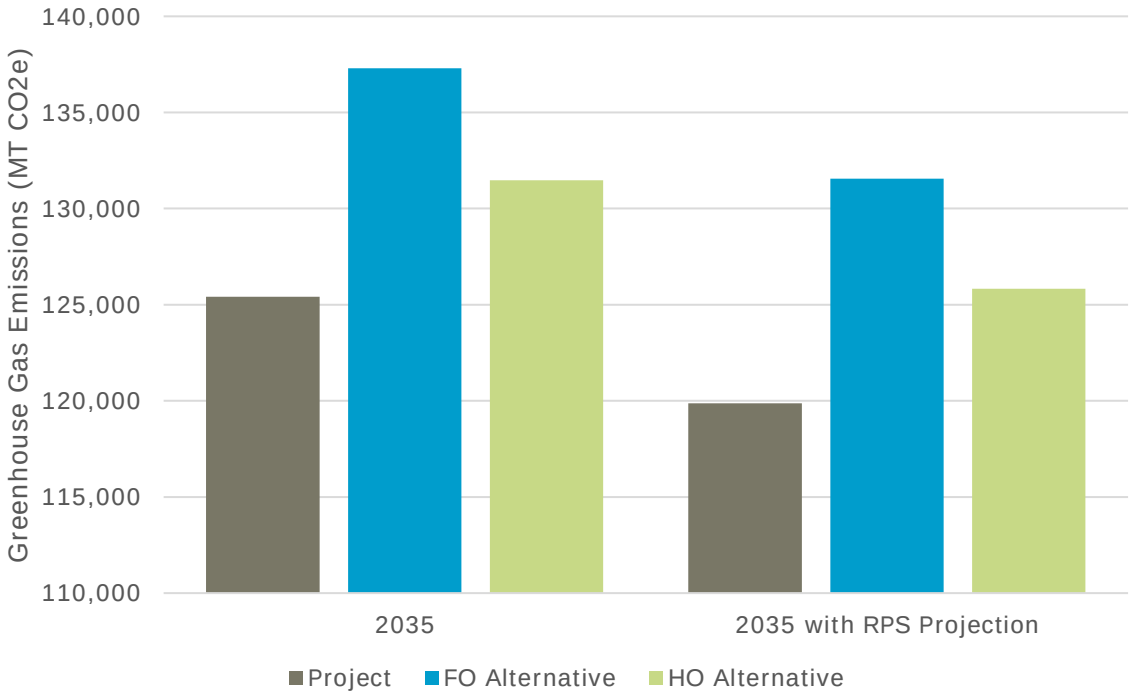

Figure 3-7. Stanford GHG Emissions per Service Population for Project and Alternatives

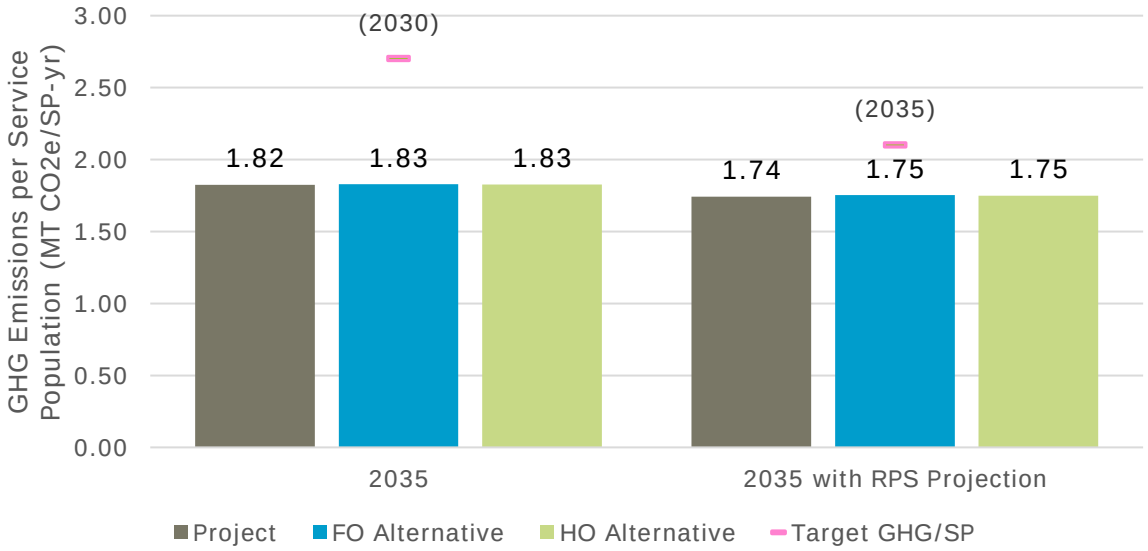

4. Significance Standards and Impact Assessment

GHG standards of significance and thresholds are discussed in DEIR Appendix GHG Section 5. The comparisons of each Alternative to the corresponding thresholds are shown below.

4.1 Environmental Analysis

Impact GHG-1a: Alternative FO Would Not Generate Greenhouse Gas Emissions, either Directly or Indirectly, that Would Make a Cumulatively Considerable Contribution to Global Climate Change. *(Less than Significant without Mitigation.)*

As described in DEIR Appendix GHG Section 5.2.1, Project emissions are compared to service population thresholds based on BAAQMD CEQA Guidelines and adjustments to the BAAQMD thresholds to incorporate the State's 2030 emissions reduction goals. The service population derivation for the Project and each Alternative is shown in **Table 4-1.**

Table 4-1: Service Population Derivation

Inventory	Number of People			
	Workers	Residents[1]	Workers Who Are Residents	Service Population[2]
Fall 2035 (Project)	49,428	19,353	17,116	68,781
Fall 2035 (FO Alternative)	49,479	25,599	19,668	75,078
Fall 2035 (HO Alternative)	49,451	22,479	18,393	71,930

Notes:
[1.] Number of residents is shown in Fehr & Peers 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis (2018), Table 3.
[2.] Service population is defined as the sum of the residential population and the workers, as shown in Table D-7 of May 2017 BAAQMD CEQA Guidelines. If a resident works on-site, that person is counted as both a resident and a worker.

As described in DEIR Appendix GHG Section 5.1.2, emissions are compared to a 2030 threshold of 2.7 MT of CO_2e per service population and a 2035 threshold of 2.1 MT of CO_2e per service population that are derived from the BAAQMD methodology. The FO Alternative efficiency metric is estimated to be 1.83 MT of CO_2e per service population in 2030. Under these long-term thresholds, the Project would not result in a cumulatively considerable contribution to global climate change.

The FO Alternative emissions inventory is based on adopted 2030 regulatory measures (e.g., RPS) and emission factors (e.g., EMFAC2014 mobile factors), assuming complete buildout of the 2018 GUP. If 2035 emission factors were developed, the total GHG emissions would be even lower than in 2030. Therefore, this comparison is a conservative estimate of the anticipated 2035 Project emissions.

As another point of comparison, the Fall 2035 FO Alternative with RPS Projection inventory was also prepared to represent FO Alternative emissions in Fall 2035, incorporating intensity factors for electricity generation consistent with expected implementation of renewable portfolio standards in 2035. This inventory results in an efficiency metric of 1.75 MT of CO_2e per service population, which is below the 2.1 MT of CO_2e per service population derived from the BAAQMD methodology for year 2035. This comparison is still conservative since other factors such as 2035 mobile emissions factors are not incorporated in the inventory.

Impact GHG-1b: Alternative HO Would Not Generate Greenhouse Gas Emissions, either Directly or Indirectly, that Would Make A Cumulatively Considerable Contribution to Global Climate Change. *(Less than Significant without Mitigation.)*

The HO Alternative service population and thresholds are described above. The HO Alternative efficiency metric is estimated to be 1.83 MT of CO_2e per service population in 2030. Under these long-term thresholds, the Project would not result in a cumulatively considerable contribution to global climate change. As another point of comparison, the Fall 2035 HO Alternative with RPS Projection inventory was also prepared to represent HO Alternative emissions in Fall 2035, incorporating intensity factors for electricity generation consistent with expected implementation of renewable portfolio standards in 2035. This inventory results in an efficiency metric of 1.75 MT of CO_2e per service population, which is below the 2.1 MT of CO_2e per service population derived from the BAAQMD methodology for year 2035. This comparison is still conservative since other factors such as 2035 mobile emissions factors are not incorporated in the inventory.

Impact GHG-2a: Alternative FO Would Be Consistent with AB 32, the ARB Scoping Plan, the Region's Sustainable Communities Strategy / Regional Transportation Plan (Plan Bay Area), Executive Order S-3-05, Executive Order B-16-12, and SB 32. (*Less than Significant with Mitigation.*[9])

The DEIR Appendix GHG Section 5.2 describes that the Project has been evaluated for consistency with the following plans, policies, and regulations:

- AB 32 (California Global Warming Solutions Act of 2006), including:
  - ARB Scoping Plan

[9] Proposed mitigation under Alternative FO is consistent with the mitigation measures proposed in DEIR Table 1-2, Impact 5.7-2.

- Plan Bay Area
- Executive Order S-3-05
- Executive Order B-30-15
- SB 32

The change from the Project to the FO Alternative is not expected to affect the consistency evaluations. In summary, because the FO Alternative meets and exceeds the emissions reduction targets presented in this report for 2030 and 2035, and because many aspects of the FO Alternative's emissions inventory will benefit from further regulatory and technological advancements, the FO Alternative is not expected to obstruct the attainment of the Governor's long-term GHG reduction goal for 2050. Therefore, the Project's impacts are **less than significant** under this methodology.

Impact GHG-2b: Alternative HO Would Be Consistent with AB 32, the ARB Scoping Plan, the Region's Sustainable Communities Strategy / Regional Transportation Plan (Plan Bay Area), Executive Order S-3-05, Executive Order B-16-12, and SB 32. *(Less than Significant with Mitigation.*[10]*)*

The DEIR Appendix GHG Section 5.2 describes that the Project has been evaluated for consistency with the following plans, policies, and regulations:

- AB 32 (California Global Warming Solutions Act of 2006), including:
  - ARB Scoping Plan
- Plan Bay Area
- Executive Order S-3-05
- Executive Order B-30-15
- SB 32

The change from the Project to the HO Alternative is not expected to affect the consistency evaluations. In summary, because the HO Alternative meets and exceeds the emissions reduction targets presented in this report for 2030 and 2035, and because many aspects of the HO Alternative's emissions inventory will benefit from further regulatory and technological advancements, the HO Alternative is not expected to obstruct the attainment of the Governor's long-term GHG reduction goal for 2050. Therefore, the Project's impacts are **less than significant** under this methodology.

[10] Proposed mitigation under Alternative HO is consistent with the mitigation measures proposed in DEIR Table 1-2, Impact 5.7-2.

Notes:

1. As described in the GHG Report, the Fall 2035 inventories assume full development of the proposed 2018 General Use Permit, applying emission factors consistent with 2030. This is conservative, as the electricity intensity factors, mobile emission factors, and other GHG sources are expected to continue to decrease after 2030 to meet California's long-term GHG reduction goals. The Fall 2035 With RPS Projection scenarios incorporate anticipated renewable portfolio standards in 2035, which reduce the electricity intensity factors. The FO and HO Alternatives inventories include emissions changes due to additional graduate student beds and faculty/staff housing compared to the Project.
2. Data from Stanford. Propane, solid & gaseous CO_2, and acetylene are all used in on-campus research, with emissions based on purchase records from Stanford suppliers for calendar year 2015. The fire suppression system category includes both handheld fire extinguishers and larger fire suppression systems. Data from the campus Fire Marshall on the testing and discharge of fire suppression systems. In 2015, Stanford did not have any events that caused GHG leakage from the larger fire suppression systems (and only fans are activated during testing so there is no associated GHG leakage), so the number used simply captures the CO_2 released from the 40 fire extinguishers that were discharged throughout the course of the year.
3. For the Project inventory, construction emissions are estimated using CalEEMod® 2013.2.2 using the average annual square footage of construction and demolition and estimated excavation from fiscal year 2001 through fiscal year 2015 with default construction schedules and equipment lists. For the Alternatives inventories, construction emissions are added for the annual average number of additional dwelling units. For all inventories, construction equipment is all assumed to meet Final Tier 4 standards, except for chainsaws and paving phase equipment. Construction on-road emissions (worker, vendor, and hauling trips) are included in the mobile sources.

Notes

1. Fall 2020 annual electricity use details are shown in DEIR Appendix GHG Table 3-6-5.

2. Scaling for the FO Alternative is primarily based on the increase in academic square footage and student housing expected from Fall 2020 to full buildout of the 2018 GUP (22%), plus additional electricity for student housing from the Alternative as described in footnote 6. Since the majority of electricity consumption within the study area is within the Campus and CEF Consumption category, all increases are assigned to this category, with no expected changes in electricity use for the other providers, except for the additional faculty/staff housing added separately. Electricity use is assumed to scale linearly; e.g., efficiency of new buildings is assumed equal to current buildings. This is conservative, since newer buildings should be more energy efficient than older buildings.

3. CO_2 emission factors are shown in DEIR Appendix GHG Table 3-5-1. The PGE and WECC California emission factors are based on the utility achieving the State goal of 50% RPS in 2030. CH_4 and N_2O emission factors are assumed not to change from estimates for earlier years.

4. Global warming potentials are based on the IPCC Fourth Assessment Report.

5. The campus and CEF consumption emission factor is a weighted average between electricity from direct access electricity service providers and electricity from Stanford's solar panels. According to Stanford's Office of Sustainability, on-campus solar panels are expected to generate approximately 7,300 MWh/year, while the Stanford Solar Generation Farm is expected to generate 159,000 MWh/year. The 166,300 MWh/year are given an emission factor of 0 lb/MWh, while the remaining electricity use is assigned the WECC California emission factor adjusted for 50% RPS.

6. Electricity consumption from the 2,892 new faculty/staff high density homes and additional 83 graduate dwelling units (207 beds) to be constructed within the study boundary under this alternative was calculated using the following assumption: The annual electricity use is based on the CalEEMod® version 2013.2.2 default for condo/townhouse built to 2008 Title 24 standards in climate zone 4, adjusted to an approximation of 2016 Title 24 standards (effective January 1, 2017). The adjustments are shown below. This energy consumption is likely conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to require residences to achieve higher efficiency with each code cycle. The faculty/staff houses are assumed to contract electricity with PGE, while the electricity use from the Project's student housing is added into the 'Campus and CEF Consumption' category.

CalEEMod® Table 8.1 Energy Use for Condo/Townhouse (kWh/DU)				Adjustment from 2008 to 2013 T24 Electricity[a]	Adjustment from 2013 to 2016 T24 Electricity[b]	Adjustment from 2008 to 2016 T24 Lighting[c]	Total Electricity for 2016 T24-Compliant Residence

7. Areas on campus for which Stanford did not provide detailed natural gas data include the Searsville Block and Olmsted Staff faculty/staff housing. The annual electricity use is based on the CalEEMod® 2013.2.2 default for single family homes built to 2008 Title 24 standards in climate zone 4.

8. This category includes commercial buildings that are located on the Stanford campus in unincorporated Santa Clara County but are not under Stanford's operational control. Examples include the U.S. Post Office and the Carnegie Institute of Washington. In 2014, the electricity source for this category was Cardinal Cogen. The electricity use data was provided by Stanford. assumes no changes in electricity consumption for 2035 and that PGE is the default electricity provider.

PGE New Faculty/Staff Housing[6]	0	N/A	34,339				1,823
Hot Water Generators (Central Energy Facility)	109,605	22%	133,845				7,104
Replacement Process Steam Plant	89,021	22%	108,709				5,770
Total	**587,429**		**747,236**				**39,659**

Notes:

1. Fall 2020 natural gas use details are shown in DEIR Appendix GHG Table 3-6-11.
2. Scaling for the FO Alternative is primarily based on the increase in academic square footage and student beds expected from Fall 2020 to full buildout of the 2018 GUP, including the increase in housing for this alternative. The majority of PGE Residential addresses are student housing, so the increase is based on number of beds. PGE Commercial, the CEF, and the Replacement Process Steam Plant serve largely academic buildings, so the increase is based on academic square footage. Estimates for new faculty/staff housing are added. The six individual replacement boilers are not expected to increase in use. Gas use is assumed to scale linearly; e.g. efficiency and use in new buildings is assumed equal to current buildings. This is likely very conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to result in lower natural gas usage in new buildings.
3. GHG emissions are calculated based on CO_2, CH_4, and N_2O emission factors presented in Tables C-1 and C-2 of the Federal Mandatory Greenhouse Gas Reporting Regulation (40 CFR 98). GWPs are based on the IPCC Fourth Assessment Report.
4. The six individual replacement boilers are not expected to increase in gas consumption. Based on matching up PGE commercial addresses, estimated the gas consumption from these boilers and separated this from the total PGE commercial gas. Not all boilers addresses could be matched, and not all gas used at a given address is necessarily due to the boilers, so this breakdown is approximate.
5. Areas on campus for which Stanford did not provide detailed natural gas data include the Searsville Block and Olmsted Staff faculty/staff housing. The annual gas use is based on the CalEEMod® default for single family homes built to 2008 Title 24 standards in climate zone 4.
6. This represents the natural gas consumption from the 2,892 new faculty/staff high density homes to be constructed within the study boundary under this alternative. The annual natural gas use is based on the CalEEMod® version 2013.2.2 default for condo/townhouse built to 2008 Title 24 standards in climate zone 4, adjusted to an approximation of 2016 Title 24 standards (effective January 1, 2017). The adjustments are shown below. This is likely very conservative, as improved California Building Energy Efficiency Standards (Title 24, Part 6) are expected to require residences to achieve higher efficiency with each code cycle.

Table 3-6
FO Alternative GHG Emissions - Mobile Use
Stanford University
Stanford, CA

Notes:

1. Trip information is provided by Fehr & Peers or derived using data from the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. Greyed out cells are either not needed for this analysis (e.g., off-road equipment trips per year) or irrelevant because the assumptions are already embedded into the VMT analysis (e.g., trip lengths for workers).
2. Number of vehicles and trips per vehicle are used to estimate starting and idling emissions. The number of vehicles for residents is based on parking permits. For workers and other trips types, number of vehicles is based on trips per year divided by commuting or driving to campus days per year. Trip counts for worker and resident trips, visitors, and vendors are provided by Fehr & Peers in the SB 743 Analysis. Trip count for shuttles/buses is provided by Stanford. Bonair, PSSI, and Public Safety trip counts are calculated from total vehicle trips and number of vehicles in the fleet. Total vehicle trips per year calculated from total VMT divided by the trip length or provided by Fehr & Peers.
3. VMT per year for the FO Alternative is based on data provided by Fehr & Peers.
4. VMT for on-road campus vehicles is split into four categories: Bonair, Marguerite, PSSI, and Public Safety. Bonair vehicles are separated by fuel type and vehicle weight class and uses gallons of fuel used with the EMFAC mpg for that vehicle class in Santa Clara county to estimate VMT. Diesel fuel usage, number of vehicles, and trip rate/length was obtained from Stanford and used to estimate PSSI vehicle emissions. Stanford indicated that their on-campus fleet will incorporate higher percentages of electric vehicles over time. The on-campus fleet for the Fall 2020 inventory was estimated to be 40% electric and is expected to be 70% electric by 2035. Since emissions for the 2020 inventory were based on fueling data (no data on electric vehicles), emissions from on-campus vehicles for 2035 are scaled down assuming only 30% non-electric vehicles contribute to emissions in 2035 versus 60% in 2020. Additionally, Stanford expects the entire Marguerite fleet to be electric by 2035. Fuel usage and number of vehicles in the fleet were provided by Stanford for public safety vehicles; these are assumed to be a fleet of light duty vehicles.
5. Fuel usage for off-road Stanford vehicles was provided by Stanford and is assumed to remain constant from 2015 to 2035. Conversion factors (for gas and diesel) were used to convert gallons of fuel to bhp-hr. CalEEMod® emission factors were then used to estimate CO_2 emissions.
6. Conversion factors from fuel usage to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES).
7. Off-road equipment emission factors for smaller gasoline equipment are from CalEEMod® Table 7.2 under category "Other Lawn and Garden Equipment." Emission factors for light towers are from CalEEMod® Table 3.4 under category "Generator Sets" and emission factors from diesel off-road equipment are from CalEEMod® Table 3.4 under category "Other General Industrial Equipment" for equipment between 6-50 HP.
8. EMFAC2014 mpg is calculated by summing the VMT for specific weight classes and dividing by the fuel consumption. Emission factors are shown in DEIR Appendix GHG Appendix C.
9. Bhp-hr per year for Siebel and Red Barn off-road equipment is estimated from fuel consumption using a conversion factor (for gas and diesel) to convert from gallons to bhp-hr.
10. Marguerite buses are assumed to all be electric by 2035. By Fall 2018, assumed that the Bonair fleet, by switching from a "service yard" system to a "hub" system, will see a 5% reduction in VMT from Bonair vehicles. By 2035, 70% of the Bonair fleet is assumed to be electric, in comparison to a 40% electric fleet in 2018.
11. Since EMFAC2014 does not incorporate the GHG benefits of the NHTSA Phase 2 regulation (adopted in August 2016), emissions for medium- and heavy-duty vehicles are overestimated for the 2035 operational year. USEPA. Available at: https://www3.epa.gov/otaq/climate/documents/420f16044.pdf
12. EMFAC emission factors used for calculating on-road emissions are summarized in DEIR Appendix GHG Appendix C. CH_4 and N_2O are expected to be very minor contributors to total mobile GHGs and were not quantified.
13. Vendor and Hauling VMT are based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction. This consists of 37 trips per day, 7.3 miles per trip for the 230 day building construction phase each year for vendor trips, and 7,987 trips per year, 20 miles per trip for haul trips. Additional vendor and hauling trips added for the FO Alternative construction consist of 14 vendor trips/day for 220 days and 10,369 trips/year for haul trucks. These VMT and emissions are a sub-category of the 'Other Trips - Trucks' VMT because these trips would be counted in the Fehr & Peers cordon reconciliation analysis and because the primary vehicle type would be medium- and heavy-duty vehicles. Because over 90% of MHDT and HHDT trucks are diesel in the EMFAC2014 fleet, the diesel emission factors for the overall "Trucks" category are used here.

Table 3-7
HO Alternative GHG Emissions - Mobile Use
Stanford University
Stanford, CA

Notes:

1. Trip information is provided by Fehr & Peers or derived using data from the Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis. Greyed out cells are either not needed for this analysis (e.g., off-road equipment trips per year) or irrelevant because the assumptions are already embedded into the VMT analysis (e.g., trip lengths for workers).
2. Number of vehicles and trips per vehicle are used to estimate starting and idling emissions. The number of vehicles for residents is based on parking permits. For workers and other trips types, number of vehicles is based on trips per year divided by commuting or driving to campus days per year. Trip counts for worker and resident trips, visitors, and vendors are provided by Fehr & Peers in the SB 743 Analysis. Trip count for shuttles/buses is provided by Stanford. Bonair, PSSI, and Public Safety trip counts are calculated from total vehicle trips and number of vehicles in the fleet. Total vehicle trips per year calculated from total VMT divided by the trip length or provided by Fehr & Peers.
3. VMT per year for the HO Alternative is based on data provided by Fehr & Peers.
4. VMT for on-road campus vehicles is split into four categories: Bonair, Marguerite, PSSI, and Public Safety. Bonair vehicles are separated by fuel type and vehicle weight class and uses gallons of fuel used with the EMFAC mpg for that vehicle class in Santa Clara county to estimate VMT. Diesel fuel usage, number of vehicles, and trip rate/length was obtained from Stanford and used to estimate PSSI vehicle emissions. Stanford indicated that their on-campus fleet will incorporate higher percentages of electric vehicles over time. The on-campus fleet for the Fall 2020 inventory was estimated to be 40% electric and is expected to be 70% electric by 2035. Since emissions for the 2020 inventory were based on fueling data (no data on electric vehicles), emissions from on-campus vehicles for 2035 are scaled down assuming only 30% non-electric vehicles contribute to emissions in 2035 versus 60% in 2020. Additionally, Stanford expects the entire Marguerite fleet to be electric by 2035. Fuel usage and number of vehicles in the fleet were provided by Stanford for public safety vehicles; these are assumed to be a fleet of light duty vehicles.
5. Fuel usage for off-road Stanford vehicles was provided by Stanford and is assumed to remain constant from 2015 to 2035. Conversion factors (for gas and diesel) were used to convert gallons of fuel to bhp-hr. CalEEMod® emission factors were then used to estimate CO_2 emissions.
6. Conversion factors from fuel usage to bhp-hr for off-road equipment originate from the USEPA Nonroad Engine and Vehicle Emission Study (NEVES).
7. Off-road equipment emission factors for smaller gasoline equipment are from CalEEMod® Table 7.2 under category "Other Lawn and Garden Equipment." Emission factors for light towers are from CalEEMod® Table 3.4 under category "Generator Sets" and emission factors from diesel off-road equipment are from CalEEMod® Table 3.4 under category "Other General Industrial Equipment" for equipment between 6-50 HP.
8. EMFAC2014 mpg is calculated by summing the VMT for specific weight classes and dividing by the fuel consumption. Emission factors are shown in DEIR Appendix GHG Appendix C.
9. Bhp-hr per year for Siebel and Red Barn off-road equipment is estimated from fuel consumption using a conversion factor (for gas and diesel) to convert from gallons to bhp-hr.
10. Marguerite buses are assumed to all be electric by 2035. By Fall 2018, Ramboll assumed that the Bonair fleet, by switching from a "service yard" system to a "hub" system, will see a 5% reduction in VMT from Bonair vehicles. By 2035, 70% of the Bonair fleet is assumed to be electric, in comparison to a 40% electric fleet in 2018.
11. Since EMFAC2014 does not incorporate the GHG benefits of the NHTSA Phase 2 regulation (adopted in August 2016), emissions for medium- and heavy-duty vehicles are overestimated for the 2035 operational year. USEPA. Available at: https://www3.epa.gov/otaq/climate/documents/420f16044.pdf
12. EMFAC emission factors used for calculating on-road emissions are summarized in DEIR Appendix GHG Appendix C. CH_4 and N_2O are expected to be very minor contributors to total mobile GHGs and were not quantified.
13. Vendor and Hauling VMT are based on the defaults that would be calculated using CalEEMod 2013.2.2 for Santa Clara County based on the annual average construction. This consists of 37 trips per day, 7.3 miles per trip for the 230 day building construction phase each year for vendor trips, and 7,987 trips per year, 20 miles per trip for haul trips. Additional vendor and hauling trips added for the HO Alternative construction consist of 7 vendor trips/day for 220 days and 5,184 trips/year for haul trucks. These VMT and emissions are a sub-category of the 'Other Trips - Trucks' VMT because these trips would be counted in the Fehr & Peers cordon reconciliation analysis and because the primary vehicle type would be medium- and heavy-duty vehicles. Because over 90% of MHDT and HHDT trucks are diesel in the EMFAC2014 fleet, the diesel emission factors for the overall "Trucks" category are used here.

			Total for Fall 2018/2020	**363**
			Scaling Factor for Fall 2035 and Alternatives[2]	22%
			Total for Fall 2035, FO Alternative, and HO Alternative	**444**

Notes:

1. List of campus-wide emergency generators along with their BAAQMD ID, year, and engine rating was provided by Stanford for 2015. There are four generators smaller than 50 hp that are exempt from permitting; they are conservatively assumed to be 50 hp each for emission calculations.

2. 2015 is based on actual non-emergency and emergency run hours in 2015. For Fall 2018 and Fall 2020, it is assumed that the number of generators will increase proportional to the increase in academic square footage (8%); however, since the size and type of generator is unknown, assumed an 8% increase in total emissions. This same methodology was used to represent the increase in academic square footage from Fall 2020 to the buildout of the 2018 GUP (an additional 22% increase). Since the Alternatives do not result in increased academic building space, no change is assumed from the Project to the Alternatives.

3. A representative GHG emission factor (in g/hp-hr) was derived for emergency generators because fuel consumption rate information was not available for all units. The emission factor was derived by taking the emission factor for diesel fuel (22.6 lb/gal), converting to grams, and normalizing by a fuel rate (34.7 gal/hr) and horsepower (755 HP) of a representative engine (Cummins, QSX15-G9 NR 2, @ 1800 RPM). The GHG CO_2e emission factor in lb/gal for diesel fuel was obtained from the CO_2, CH_4 and N_2O emission factors found in 40 CFR Part 98 Mandatory Greenhouse Gas Reporting Tables C-1 and C-2. Note that according to the Regulation, diesel fuel is defined as distillate fuel oil in Table C-1 and petroleum in Table C-2. Global warming potentials are from IPCC Fourth Assessment Report.

Table 3-9
FO Alternative GHG Emissions - Solid Waste
Stanford University
Stanford, CA

Change from DEIR Fall 2035 analysis

	Fall 2020 Amount of Waste Disposed[1]	Campus Scaling for FO Alternative[2]	Waste for new Faculty/Staff and Additional Graduate Housing[2]	FO Alternative Amount of Waste Disposed	Diversion Rate[1,2]	Amount of Waste Sent to Landfill	Collection Efficiency[3]	Destruction Efficiency[3]	Oxidation efficiency of methane[3]	Generation Fraction[4]	Amount emitted[5,6]	GWP[7]	CO_2e
	[Ton/Year]	[%]	[Ton/Year]	[Ton/Year]	[%]	[Ton/Year]	[%]	[%]	[%]	[Ton CH_4 or CO_2 / Ton waste]	[MT/year]	[-]	[MT/year]
CH_4	26,021	22%	6,577	38,353	66%	13,213	75%	98%	10%	0.05	136	25	3,401
CO_2										0.13	2,744	1	2,744
												Total	6,145

Notes:

1. Waste disposal and diversion rates for Fall 2020 from Stanford as shown in DEIR Appendix GHG Table 3-6-23. Waste disposal and diversion rates for 663 Stanford faculty/staff houses was provided and used to estimate the waste from only the 38 houses within the study area (Searsville and Olmstead). The waste per house (before diversion) was calculated as 2.21 tons per year per house, and the diversion rate was consistent with the overall campus diversion rate. Therefore, 38 houses x 2.21 tons/house was included in the amount of waste disposed, and the waste from the 625 faculty/staff houses outside the study area was excluded.
   Calculation of amount of waste disposed: (Amount diverted)/(Amount diverted + amount disposed to landfill) = 66%, solve for amount diverted and add amount sent to landfill
2. The solid waste disposal data from Stanford gives one total for the entire campus, including faculty/staff housing, student housing, and academic buildings. Scaling for Fall 2035 is based on the increase in academic square footage expected from Fall 2020 to full buildout of the 2018 GUP plus the Alternative. Waste disposal for the 2,892 new faculty/staff high density homes and additional 83 graduate dwelling units (207 beds) is estimated based on 2015, with the waste per house (before diversion) calculated as 2.21 tons per year per house; therefore, 2,975 units x 2.21 tons/house is added to the amount of waste disposed. Waste disposal is assumed to scale linearly; i.e., disposal rates in new buildings is assumed equal to current buildings. The diversion rate is assumed to remain constant from 2015.
3. Waste is sent to Newby Island Landfill, which contains an LFG collection and destruction system. Collection efficiency, destruction efficiency, and oxidation efficiency based on CalEEMod® 2013.2.2 defaults for a landfill with LFG collection.
4. Generation fraction from CalEEMod® Appendix D table 10.2 assuming 75% collection efficiency, 98% destruction efficiency, and 10% oxidation efficiency of methane.
5. CO_2 amount emitted = amount of waste disposed x (1 - diversion rate) x generation fraction x (collection fraction x destruction fraction x (1 - collection fraction) x oxidation fraction +1)
6. CH_4 amount emitted = amount of waste disposed x (1 - diversion rate) x generation fraction x (collection fraction x (1 - destruction fraction) + (1 - collection fraction) x (1 - oxidation fraction))
7. GWP from IPCC 4th report

Notes:

1. Fall 2020 Stanford water use is as shown in DEIR Appendix GHG Table 3-6-28.
2. 2035 water use rates are from the April 2017 Water Supply Assessment (WSA), which were based on pre-drought water use rates. The water use rate in Mgal/day is multiplied by 365 days to result in the totals in Mgal/yr. Assumes wastewater (sewer water) will increase at the same overall rate as domestic water use. Total water use is lower than the WSA because it does not include the faculty/staff houses outside the Study Area. Additional housing from the Alternative is assumed to result in the same water use rate on a per unit basis as for the Project.
3. Emission factors for Santa Clara county from CalEEMod® 2013.2.2 Appendix D Table 9.2.
4. The PGE emission factor is based on the achieving 50% RPS in 2030 consistent with SB 350 and SB 32. See DEIR Appendix GHG Table 3-5-1 for derivation.
5. Emissions are calculated based on the CalEEMod® version 2013.2.2 default factors for 'Santa Clara County' for the total wastewater quantity. This does not account for any recycled water or wastewater recovery. Direct emissions are based on a default split between septic tank, aerobic, and anaerobic wastewater treatment types (10.33%, 87.46%, and 2.21% respectively), as shown in CalEEMod® Appendix D Table 9.4. The gas produced by anaerobic digesters may be flared or sent to a cogeneration process; in this calculation, it is assumed all gas is flared or released as fugitive methane, as this is the default described in CalEEMod® Appendix A Section 8.4.

APPENDIX A

Stanford Construction/Demolition, FO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	135.00	Dwelling Unit	2.11	135,000.00	386

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2018
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - Additional construction for alternative

Construction Phase - Changed start year for construction to 2018. Made schedule fit in 1 year

Trips and VMT - Off-road only

Demolition - Expected demolition according to FO alternative

Grading -

Architectural Coating -

Vehicle Trips - not modeling operation here

Vechicle Emission Factors - Not modeling operational emissions

Vechicle Emission Factors - Not modeling operational emissions

Vechicle Emission Factors - Not modeling operational emissions

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - not modeling operations

Area Coating - not modeling operation

Landscape Equipment - not modeling operation

Energy Use - not modeling operation

Water And Wastewater - not modeling operation

Solid Waste - not modeling operation

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido.

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation -

Water Mitigation - Not modeling operational emissions

Stanford Construction/Demolition, HO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	67.00	Dwelling Unit	1.05	67,000.00	192

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2018
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - HO Alternative average construction

Construction Phase - Changed start year for construction to 2018. Made schedule fit in 1 year

Trips and VMT - Offroad only.

Demolition - Expected demolition for the HO Alternative

Grading - Average annual excavation for the HO alternative

Architectural Coating -

Vehicle Trips - Not modeling operational emissions

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - Not modeling operational emissions

Area Coating - Not modeling operational emissions

Landscape Equipment - Not modeling operational emissions

Energy Use - Not modeling operational emissions

Water And Wastewater - Not modeling operational emissions

Solid Waste - Not modeling operational emissions

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido.

Mobile Land Use Mitigation - Not modeling operational emissions

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation - Not modeling operational emissions

Water Mitigation - Not modeling operational emissions

Waste Mitigation - Not modeling operational emissions

Stanford Construction/Demolition, FO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	135.00	Dwelling Unit	2.11	135,000.00	386

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2030
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - Additional construction for alternative

Construction Phase - Changed start year for construction to 2030. Made schedule fit in 1 year

Trips and VMT - Off-road only

Demolition - Expected demolition according to FO alternative

Grading -

Architectural Coating -

Vehicle Trips - not modeling operation here

Vechicle Emission Factors - Not modeling operational emissions

Vechicle Emission Factors - Not modeling operational emissions

Vechicle Emission Factors - Not modeling operational emissions

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - not modeling operations

Area Coating - not modeling operation

Landscape Equipment - not modeling operation

Energy Use - not modeling operation

Water And Wastewater - not modeling operation

Solid Waste - not modeling operation

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation -

Water Mitigation - Not modeling operational emissions

Stanford Construction/Demolition, HO Alternative

Santa Clara County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Condo/Townhouse High Rise	67.00	Dwelling Unit	1.05	67,000.00	192

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	5			**Operational Year**	2030
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	434.91	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Actual 2014 PGE emission factor

Land Use - HO Alternative average construction

Construction Phase - Changed start year for construction to 2030. Made schedule fit in 1 year

Trips and VMT - Offroad only.

Demolition - Expected demolition for the HO Alternative

Grading - Average annual excavation for the HO alternative

Architectural Coating -

Vehicle Trips - Not modeling operational emissions

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Road Dust - Not modeling operational emissions

Woodstoves - Not modeling operational emissions

Consumer Products - Not modeling operational emissions

Area Coating - Not modeling operational emissions

Landscape Equipment - Not modeling operational emissions

Energy Use - Not modeling operational emissions

Water And Wastewater - Not modeling operational emissions

Solid Waste - Not modeling operational emissions

Construction Off-road Equipment Mitigation - Tier 4 final for all equipment except pavers, paving equipment, rollers, and concrete/industrial saws. Based on Escondido

Mobile Land Use Mitigation - Not modeling operational emissions

Mobile Commute Mitigation - Not modeling operational emissions

Area Mitigation - Not modeling operational emissions

Energy Mitigation - Not modeling operational emissions

Water Mitigation - Not modeling operational emissions

Waste Mitigation - Not modeling operational emissions

Operational Off-Road Equipment - Not modeling operations

memorandum

date	March 28, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Cory Barringhaus - ESA
subject	**ESA Peer Review of Stanford University 2018 General Use Permit EIR: Housing Alternative Population and Housing Analysis**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Housing Alternative Population and Housing Analysis* memo on March 16, 2018.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated the memo accordingly. The memo was revised by Stanford on March 28 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor numerical and editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Housing Alternative Population and Housing Analysis* memo is appropriate for use as reference in the EIR.

memorandum

date March 28, 2018

to Steve Piasecki, County of Santa Clara

cc Brian Boxer, ESA; Paul Mitchell, ESA

from Catherine Palter, Stanford University; Karen Hong, Stanford University

subject 2018 General Use Permit EIR: Housing Alternative Population and Housing Analysis *Revised*

To support the two alternatives that Santa Clara County has elected to study in response to comments on the 2018 Stanford General Use Permit Draft EIR, this technical report analyzes the potential impacts on population and housing.

The County has chosen to study the following two housing alternatives which would provide housing within the Academic Growth Boundary at the following levels:

- Full Offset Housing Alternative: Adds to the proposed project 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- Half Offset Housing Alternative: Adds to the proposed project 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

The analyses in **Tables 1** and **Table 2** below show the remaining increase in Stanford affiliates who would live off-campus during the 2018 General Use Permit period, and estimates the number of households that each of these individuals would represent.

Nonmatriculated students are not included in the projected growth in off-campus housing demand, just as nonmatriculated students were not included in the projected growth off-campus housing demand in Table 5.12-11 in the Draft EIR. Nonmatriculated students are industry professionals and community members who take courses at Stanford over the short term (ranging from a few hours to a few months), but who are not receiving credit toward a degree. They include students who complete courses entirely online, and students taking courses on a part-time basis. This population is included in the overall population totals, but it is not relevant to the anticipated demand for new housing. Those who are distance learners do not generate a housing need. It is highly unlikely that those who come to campus, to take courses for which they do not receive credits, moved into the area to do so.

Per the earlier analysis presented in Appendix PHD of the DEIR, factors have been applied to convert jobs to households off-campus, as well as when the projected population off-campus is provided on-campus housing. To recapitulate the methodology for conversion to households, the analysis recognizes that if an added Stanford employee lives in a household with one or more other workers, that added employee is not responsible for creating demand for an entire additional housing unit, only a portion of an additional unit. The assumption is that the Stanford worker is responsible for the fraction of the household that corresponds to the number of workers per household for the particular affiliate group.

Table 1: Projected Growth in Off-Campus Households under Full Offset Housing Alternative

	Undergrads	Graduate Students	Postdoctoral Students	Faculty	Staff	Other Workers	Total
Total Growth through 2035	1,700	1,200	961	789	2,438	1,074	8,162
Less: Stanford Population Housed on Campus (a)	(1,700)	(918)	N/A	(550)	N/A	N/A	(3,168)
Net Increase in Off-Campus Population under Proposed Project	0	282	961	239	2,438	1,074	4,994
Less: Non-Stanford Population in On-Campus Housing under Proposed Project (b)	0	(72)	0	(418)	0	0	(490)
Net Increase in Off-Campus Population under Proposed Project	**0**	**210**	**961**	**(179)**	**2,438**	**1,074**	**4,504**
Increase in Off-Campus Households under Proposed Project (calculated in DEIR)	**0**	**83**	**449**	**(102)**	**1,385**	**610**	**2,425**
Total beds/units to be added to campus under Full Offset Alternative	*0*	*207*	*449*	*(102)*	*1,385*	*610*	*2,549*
Less: Additional Population Housed on Campus under Full Offset Alternative	0	(210)	(449)	102	(1,385)	(610)	(2,552)
Less: Additional Non-Stanford Population in On-Campus Housing under Full Offset Alternative	0	(17)	(342)[(e)]	77	(1,053)	(464)	(1,799)
Net Off-Campus Population Growth under Full Offset Alternative	**0**	**(17)**	**170**[(e)]	**0**	**0**	**0**	**153**
Increase in Off-Campus Households under Full Offset Alternative	**0**	**(7)**	**80**[(e)]	**0**	**0**	**0**	**73**
Assumptions: Off-Campus Household Adjustment Factors (c)	N/A	2.54	2.14	1.76	1.76	1.76	N/A
Assumptions: On-Campus Household Adjustment Factors (d)	N/A	1.02	1.76	1.76	1.76	1.76	N/A

Sources: Stanford University, 2016, 2017, 2018; US Census Bureau, 2011-2015.

Notes:
Totals shown may differ from the sums of individual numbers due to rounding.

(a) The on-campus housing included in the 2018 General Use Permit consists of housing for 1,700 undergraduate students and 918 graduate students along with 550 units for faculty or staff.

(b) Stanford predicts 72 non-student spouses would occupy the graduate student housing that would be included in the 2018 General Use Permit. In addition, each of the 550 staff and faculty units would accommodate at least one member of the staff or faculty, along with any other members of the faculty or staff household. This analysis assumes an average of 1.76 workers per staff or faculty household, per footnote (c) below, resulting in an average of one faculty or staff member and 0.76 non-Stanford workers per faculty or staff unit.

(c) For each population group, this analysis makes a household adjustment factor in order to translate population growth into new households to determine the increase in projected future housing unit demand attributable to the 2018 General Use Permit. For graduate students and post-doctoral scholars, the adjustment is based on the average number of employed adults per household, calculated from the 2016 Commute Survey conducted by the Stanford's Department of Parking and Transportation Services. For faculty and staff, the adjustment is based on the average number of employed residents per worker household for Santa Clara County, according to 2011-2015 American Community Survey data. The analysis does not apply a household adjustment factor to the undergraduate population because the 2018 General Use Permit includes enough on-campus undergraduate beds to accommodate the entire increase in the number of undergraduate students.

(d) Per historical data, 10% of graduate student housing on-campus would continue to be occupied by couples, of which 2% includes Stanford student spouses and 8% includes non-Stanford student spouses. There is no available data for postdoctoral scholar households on campus, and therefore the postdoctoral scholar on-campus household adjustment is conservatively assumed to be the same as that of faculty and staff.

(e) The Population and Housing section of the Draft EIR identified the demand for off-campus housing units associated with growth in postdoctoral scholars, faculty, staff and other workers. The Full Offset Housing Alternative has been designed to bring an identical number of housing units onto campus, under the assumption that these new units would be multi-family units that could be occupied by an unspecified combination of these same categories of Stanford affiliates. If postdoctoral scholars ultimately were to occupy the on-campus housing in the same proportion as their population is anticipated to grow and at the same rate of employed adults per household as occurs when postdoctoral scholars currently occupy off-campus housing (in households of 2.14 employed adults per household based on the 2016 Commute Survey), the housing demand generated by the Full Offset Housing Alternative would match the housing units provided by the Full Offset Housing Alternative.

However, because Stanford does not have data regarding on-campus household sizes for postdoctoral students and because it is not known how many of the additional housing units ultimately would be occupied by postdoctoral scholars, Stanford has made the conservative assumption in the technical analyses supporting this alternative that postdoctoral scholars living in on-campus housing would have the same household sizes as faculty, staff and other workers. This methodology assumes that postdoctoral scholars living on campus would occupy households of 1.76 employed adults per household (same as faculty, staff and other workers), which results in an unmet demand for approximately 80 off-campus housing units for postdocs.

Table 2: Projected Growth in Off-Campus Households under Half Offset Housing Alternative

	Undergrads	Graduate Students	Postdoctoral Students	Faculty	Staff	Other Workers	Total
Total Growth through 2035	1,700	1,200	961	789	2,438	1,074	8,162

Increase in Off-Campus Households under Half Offset Alternative	**0**	**38**	**265**[(e)]	**(51)**	**693**	**306**	**1,251**

Assumptions: Off-Campus Household Adjustment Factors (c)	N/A	2.54	2.14	1.76	1.76	1.76	N/A
Assumptions: On-Campus Household Adjustment Factors (d)	N/A	1.02	1.76	1.76	1.76	1.76	N/A

Sources: Stanford University, 2016, 2017, 2018; US Census Bureau, 2011-2015.

Notes:
Totals shown may differ from the sums of individual numbers due to rounding.

(a) The on-campus housing included in the 2018 General Use Permit consists of housing for 1,700 undergraduate students and 918 graduate students along with 550 units for faculty or staff.

(b) Stanford predicts 72 non-student spouses would occupy the graduate student housing that would be included in the 2018 General Use Permit. In addition, each of the 550 staff and faculty units would accommodate at least one member of the staff or faculty, along with any other members of the faculty or staff household. This analysis assumes an average of

1.76 workers per staff or faculty household, per footnote (c) below, resulting in an average of one faculty or staff member and 0.76 non-Stanford workers per faculty or staff unit.

(c) For each population group, this analysis makes a household adjustment factor in order to translate population growth into new households to determine the increase in projected future housing unit demand attributable to the 2018 General Use Permit. For graduate students and postdoctoral scholars, the adjustment is based on the average number of employed adults per household, calculated from the 2016 Commute Survey conducted by the Stanford's Department of Parking and Transportation Services. For faculty and staff, the adjustment is based on the average number of employed residents per worker household for Santa Clara County, according to 2011-2015 American Community Survey data. The analysis does not apply a household adjustment factor to the undergraduate population because the 2018 General Use Permit includes enough on-campus undergraduate beds to accommodate the entire increase in the number of undergraduate students.

(d) Per historical data, 10% of graduate student housing on-campus would continue to be occupied by couples, of which 2% includes Stanford student spouses and 8% includes non-Stanford student spouses. There is no available data for postdoctoral scholar households on campus, and therefore the postdoctoral scholar on-campus household adjustment is conservatively assumed to be the same as that of faculty and staff.

(e) The Population and Housing section of the Draft EIR identified the demand for off-campus housing units associated with growth in postdoctoral scholars, faculty, staff and other workers. The Full Offset Housing Alternative has been designed to bring an identical number of housing units onto campus, under the assumption that these new units would be multi-family units that could be occupied by an unspecified combination of these same categories of Stanford affiliates. If postdoctoral scholars ultimately were to occupy the on-campus housing in the same proportion as their population is anticipated to grow and at the same rate of employed adults per household as occurs when postdoctoral scholars currently occupy off-campus housing (in households of 2.14 employed adults per household based on the 2016 Commute Survey), the housing demand generated by the Full Offset Housing Alternative would match the housing units provided by the Full Offset Housing Alternative.

However, because Stanford does not have data regarding on-campus household sizes for postdoctoral students and because it is not known how many of the additional housing units ultimately would be occupied by postdoctoral scholars, Stanford has made the conservative assumption in the technical analyses supporting this alternative that postdoctoral scholars living in on-campus housing would have the same household sizes as faculty, staff and other workers. This methodology assumes that postdoctoral scholars living on campus would occupy households of 1.76 employed adults per household (same as faculty, staff and other workers).

Table 3 below shows the estimated distribution of off-campus Stanford households by population group, across cities and counties in the Bay Area, under the Full Offset Housing Alternative.

Table 3: Projected Growth in Off-Campus Households by Population Group and Residence Location through 2035 under the Full Offset Housing Alternative

memorandum

date	March 29, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Cory Barringhaus - ESA
subject	**ESA Peer Review of Stanford University 2018 General Use Permit EIR: Housing Alternative Description**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Housing Alternative Description* memo on March 12, 2018.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated the memo accordingly. The memo was revised by Stanford on March 30, 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor numerical and editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Housing Alternative Description* memo is appropriate for use as reference in the EIR.

memorandum

date March 30, 2018

to David Rader, County of Santa Clara

cc Brian Boxer, ESA; Paul Mitchell, ESA

from Catherine Palter, Stanford University

subject 2018 General Use Permit EIR: Housing Alternative Description *Revised 2.1*

Stanford understands the County and its consultants are responding to questions from EIR commenters asking whether building more housing on the Stanford campus could reduce environmental impacts of the proposed project. Some commenters suggest accommodating all of the off-campus housing demand (identified in the Population and Housing Chapter of the EIR as 2,425 units) on Stanford's campus lands, rather than assuming this demand for housing would be spread out among the cities where Stanford workers currently live.[1]

The County has chosen to study two alternatives in response to these comments:

- *Full Offset Housing Alternative*: Adds to the proposed project **2,549** additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of **5,699** net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- *Half Offset Housing Alternative*: Adds to the proposed project **1,275** additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of **4,425** net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

At the County's request, Stanford is providing technical data that may be useful to the County and its consultants in formulating assumptions about these alternatives. While we know the County is aware of our concerns, we must reiterate at the outset that Stanford has not applied to construct more than 3,150 net new beds/ housing units on the campus; Stanford has no plans or designs for such additional housing; and Stanford has not agreed to provide such additional housing.

Stanford's 2018 General Use Permit application does not assume staff live on the campus lands. The use of the campus land is focused on education-- student learning and discovery. Stanford houses students and faculty on the campus lands because housing faculty and students in proximity to one another directly enhances learning and research. While Stanford highly values its staff, housing staff on the campus lands does not directly foster

[1] Stanford does not agree that employment at Stanford anticipated through build out of the 2018 General Use Permit would result in an off-campus housing demand of 2,425 units. Stanford provided updated housing demand numbers to KMA in connection with the County's housing nexus study that indicated the additional worker housing demand from population predicted through 2035 would be 2,029 units.

student learning and research. For this reason, Stanford has constructed staff housing in other jurisdictions outside the campus lands.

Nonmatriculated students are not included in the projected growth in off-campus housing demand, just as nonmatriculated students were not included in the projected growth off-campus housing demand in Table 5.12-11 in the Draft EIR. Nonmatriculated students are industry professionals and community members who take courses at Stanford over the short term (ranging from a few hours to a few months), but who are not receiving credit toward a degree. They include students who complete courses entirely online, and students taking courses on a part-time basis. This population is included in the overall population totals, but it is not relevant to the anticipated demand for new housing. Those who are distance learners do not generate a housing need. It is highly unlikely that those who come to campus, to take courses for which they do not receive credits, moved into the area to do so.

"FULL OFFSET" HOUSING ALTERNATIVE

Number of Units

The Draft EIR recognizes that the 2018 General Use Permit would not directly increase the number of housing units that are constructed outside of the Stanford campus because Stanford has not proposed to build housing outside the academic campus as part of the 2018 General Use Permit. But the EIR recognizes that job growth during implementation of the 2018 General Use Permit could increase the regional population, and this population would not be entirely accommodated in residences on campus. This, in turn, and would result, indirectly, in housing demand (and associated population growth) outside of the Stanford campus. As is typical in a CEQA document for a project that brings new jobs, the EIR conservatively assumes that job growth equates to population growth, estimates where new workers might live within the region based on available data, and assesses whether the applicable cities and counties have planned for a sufficient amount of housing to accommodate the new workers. The EIR recognizes that the actual locations where employees might be housed would be dictated by the marketplace.

Table 1 shows the Draft EIR's projected increase in the number of Stanford affiliates (students, faculty, staff, and other workers) who would live off campus during the 2018 General Use Permit period, and the Draft EIR's estimates of the number of households that each of these increases in population would represent. As shown in the table, the total projected daily population growth at Stanford predicted to occur during implementation of the 2018 General Use Permit is 8,162 Stanford affiliates. The Draft EIR states that, of that number, 3,168 of those new Stanford affiliates would be housed in the proposed new on-campus housing. This leaves 4,994 new Stanford affiliates to be housed outside the campus. The Draft EIR calculates the number of new housing units that are needed in the region to house 4,994 new workers. The Draft EIR explains why this is not a one-to-one rate, and identifies the factors that are applied to translate the increase in workers to the increase in the number of housing units needed to accommodate that increase in workers:

> *Multiple-earner households have two or more workers. The analysis recognizes that if an added employee lives in a household with one or more other workers, that added employee is not responsible for creating demand for an entire additional housing unit, only a portion of that unit. There is no assumption in these household calculations that Stanford workers would live with one another. Rather the assumption is that the Stanford worker, graduate student or postdoctoral student is responsible for the fraction of the household that corresponds to the number of workers per household for the particular affiliate group.*

As shown in Table 1, the Draft EIR calculates that the projected growth in off-campus households during implementation of the 2018 General Use Permit would total 83 for graduate students, and 2,342 for the combination of postdoctoral students, staff, and other workers.

We understand that, to address comments on the Draft EIR, the County is studying the environmental impacts of a Full Housing Offset Alternative that would accommodate within the campus lands the Draft EIR's estimated demand for 83 graduate student units and 2,342 other faculty/staff housing units. To analyze such an alternative, graduate student units must first be converted to student beds.

If graduate students were housed on campus rather than off campus, they would be housed in student beds. Student beds are occupied at a ratio of 1.02 graduate students per bed. By contrast, based on data from the 2016 Commute Survey conducted by Stanford's Department of Parking and Transportation Services, off-campus housing units are occupied by graduate students at a ratio of 2.54 graduate students per unit. Thus, the bed count to house graduate students is higher than the off-campus unit count to house the same population. Keeping the other assumptions in the Draft EIR the same, Table 1 shows the total number of housing units provided by the Full Housing Offset Alternative would be 2,549 housing units/student beds (207 grad student beds and 2,342 faculty/staff units).

Table 1: Calculation of Net Increase in Housing Units Under the Full Offset Alternative

	Undergrads	Graduate Students	Postdoctoral Students	Faculty	Staff	Other Workers	Total
Total Growth During 2018 GUP	1,700	1,200	961	789	2,438	1,074	8,162
Less: Number Housed on Campus (a)	(1,700)	(918)	N/A	(550)	N/A	N/A	(3,168)
Off-Campus Stanford Population Growth	0	282	961	239	2,438	1,074	4,994
Less: Non-Stanford Population in On-Campus Housing (b)	0	(72)	0	(418)	0	0	(490)
Net Increase in Off-Campus Population	0	210	961	(179)	2,438	1,074	4,504
Draft EIR Calculation of Increase in Off-Campus Households (c)	**0**	**83**	**449**	**(102)**	**1,385**	**610**	**2,425**
Increase in Households if Beds are provided on Campus for Graduate Students rather than Off Campus Housing Units(d)		207					2,549
Assumptions							
Household Adjustment Factor **(c)**	N/A	2.54/1.02	2.14	1.76	1.76	1.76	N/A

Notes:

Totals shown may differ from the sums of individual numbers due to rounding.

(a) The on-campus housing included in the 2018 General Use Permit is assumed to consist of housing for 1,700 undergraduate students and 918 graduate students along with 550 units for faculty or staff.

(b) Stanford predicts 72 non-student spouses would occupy the graduate student housing that would be included in the 2018 General Use Permit. In addition, each of the 550 staff and faculty units would accommodate at least one member of the staff or faculty, along with any other members of the faculty or staff household. The Draft EIR analysis assumes an average of 1.76 workers per staff or faculty household, per footnote (c) below, resulting in an average of one faculty or staff member and 0.76 other workers per faculty or staff unit.

(c) For each population group, the Draft EIR makes a household adjustment factor in order to translate population growth into new households. For graduate students and post-doctorates, the adjustment is based on the average number of adults per household, calculated from the 2016 Commute Survey conducted by the Stanford's Department of Parking and Transportation Services. For faculty and staff, the adjustment is based on the average number of employed residents per worker household for Santa Clara County, according to 2011-2015 American Community Survey data. The Draft EIR does not apply a household adjustment factor to the undergraduate population because the 2018 General Use Permit includes enough on-campus undergraduate beds to accommodate the entire increase in the number of undergraduate students.

(d) Of the 210 grad students that would require beds on campus, it is likely that 2% of them would be married to Stanford-student spouses; therefore, 207 beds would be demanded.

Calculation of Resident Population

The Draft EIR also identifies the number of residents who would inhabit the new residential units proposed for the 2018 General Use Permit. The Draft EIR explains that based on current and historic occupancy rates, Stanford estimates that 10 percent of graduate student housing would continue to be occupied by couples (Stanford graduate students plus 2 percent Stanford student spouses and 8 percent non-Stanford student spouses) resulting in 1.1 residents per graduate student bed. Stanford also estimates that on average 2.57 residents would occupy each faculty/ staff housing unit.

Table 5.12-10 in the Draft EIR summarizes the anticipated population that would reside on the Project site (i.e., within the proposed 2018 General Use Permit boundary) in 2018 and 2035; this includes increases in population associated with remaining authorized housing that would be developed on-site by 2020 under the 2000 General Use Permit, and population associated with new housing that would be authorized under the proposed 2018 General Use Permit. The total estimated increase in residential population on the Project site between 2018 and 2035 would be 6,326 people, including students, faculty, staff and associated family members living on-site.

Table 2, below, modifies Table 5.12-10 in the Draft EIR to show the incremental increase in the campus residential population that would occur under a Full Housing Offset Alternative, as well as the total residential population assumed under this alternative. The calculations are based on the same occupancy factors as were used in the Draft EIR (1.1 resident per graduate student bed and 2.57 residents per faculty/staff housing unit). Household members in faculty/staff units include children.

Table 2: Stanford Population Residing on Project Site with Full Offset Alternative – 2035

Affiliation	Residential Population Within Project Site Boundary 2018	Residential Population under 2018 GUP Within Project Site Boundary 2035	Additional Change in Residential Population under Full Offset Alternative compared to Project	Total Population in 2035 (including 2018 GUP + Full Offset Alternative)
Undergraduate Students	6,617	8,317	0	8,317
Graduate Students	5,205	8,183	210	8,393
Non Student Spouses	660	894	17	911
Children	420	420	0	420
Faculty/Staff/Postdoctoral Students[a]	965	1,515	2,342	3,857
Other Family Members	1,471	2,335	3,678	6,013
Total	**15,338**	**21,664**	**6,247**	**27,911**

Source: Stanford University Land Use and Environmental Planning Office, in consultation with the Stanford University Residential and Dining Enterprises

Note: a) The number of units is calculated based on housing demand from increased faculty, staff, postdoctoral scholars and other workers. The actual occupancy of the units is unknown, and the assumptions used in the analysis are not intended to pre-judge who would live in the housing units. Rather, the units are assumed to be potentially occupiable by unspecified proportions of some or all of these groups.

Distribution of Student Beds and Housing Units

The County has asked Stanford where the additional housing units assumed under this alternative might be placed on the campus. Because Stanford has no plans to build the additional units, the University does not know

where they would be located. However, some existing data and information could be used to formulate assumptions for purposes of the analysis.

Graduate Student Beds
If additional graduate student beds were added to the campus, the most reasonable assumption appears to be that the beds would be constructed in the East Campus Development District. This is the location on the campus where the most recent graduate student housing has been approved (Escondido Village Graduate Residences) and where Stanford anticipates it would construct the 900 new graduate student housing units that are included in the application for the 2018 General Use Permit. Therefore, we suggest assuming:

- 207 additional graduate student beds in the East Campus Development District (for a total of 1,807 new student beds in this District when added to the 1,600 student beds proposed in the 2018 General Use Permit application)
- The application's proposal for 800 student beds in the Lagunita Development District and 200 student beds in the Campus Center Development District would be unaffected by the alternative.

Faculty/Staff Housing
As stated in the 2018 General Use Permit Project Objectives, Stanford prioritizes the use of campus lands within unincorporated Santa Clara County for academic and academic support facilities, student housing, and faculty housing. Stanford's application explains that the University focuses the use of its campus lands on student learning and discovery. Housing faculty and students on the campus directly enhances learning and research. While Stanford has constructed housing on its lands for staff and other Stanford affiliates, it has done so in other jurisdictions, outside the campus lands. In Stanford's view, there is no location on the lands within the Academic Growth Boundary that is appropriate for the additional faculty/staff housing contemplated by the Full Offset Alternative.

Solely for the purposes of analyzing a theoretical Full Offset Alternative, Stanford assumes that the units would have to be located in the areas currently identified for development under the 2018 General Use Permit (i.e., within the Academic Growth Boundary and not within the Campus Open Space land use designation). There are some lands outside the Academic Growth Boundary or within Campus Open Space that might at some point in the future be suitable for use as housing. But Stanford has no proposals for housing on these sites, and has not developed information as to whether placement of housing on these sites would be feasible or politically palatable.

If additional faculty/staff housing units were added to the campus lands inside the Academic Growth Boundary and outside Campus Open Space, the following factors indicate the additional housing units should be assumed to be located at the edges of campus, similar to the proposed housing in the Quarry Development District, and similar to the recently constructed faculty/staff housing on El Camino Real and Stanford Avenue. This pattern also is similar to Stanford's practice of building housing near the edges of the campus in other jurisdictions, such as the Stanford West apartments, Welch Road apartments, and University Terrace project in Palo Alto.

- The interior of the campus must remain compact and walkable so that students and faculty can travel between classes. In addition, there is a benefit for education and discovery when academic buildings are located close to one another, promoting cross-discipline exchange of information.
- Multi-family faculty/staff housing that is occupied by non-Stanford affiliates would need to be outside the academic campus lands. While the alternatives identified by the County are not based on an assumption that the housing would be occupied by non-Stanford affiliates, it is difficult to predict future housing demand and needs.

These factors suggest that no new faculty/staff housing should be assumed to be placed in the Campus Center, Lagunita and Lathrop Development Districts. Two other factors also support this assumption:

- The Lagunita Development District is constrained by a requirement of the Stanford Habitat Conservation Plan that Lagunita and land adjacent to Lagunita cannot be developed for a 50-year period.
- The Lathrop Development District is constrained by oak woodlands.

As a result, for the purpose of analysis in the Response to Comments, we suggest assuming that the additional housing units could be placed at the edges of the Quarry, West Campus, DAPER and/or East Campus Development Districts. As noted above, Stanford only supports placing faculty/staff housing at the Quarry sites, and does not support placing more than 550 units on that site. These districts are identified solely to enable the County to study the alternatives the County has decided to evaluate.

We have no additional information indicating how to distribute the units among these Development Districts. Therefore, we suggest simply assuming for purposes of the analysis that the amount of faculty/staff housing proposed in the Quarry Development District could be doubled and that the remaining additional housing units could be equally distributed in the West Campus, DAPER, and East Campus Development Districts. Under that logic, the 2,342 additional faculty/staff units could be assumed to be located as follows:

- 550 additional faculty/staff units in the Quarry Development District (for a total of 1,100 faculty/staff units in the Quarry Development District when added to the 550 units proposed by Stanford in the 2018 General Use Permit application)
- 460 faculty/staff units in the East Campus Development District, located at the edge of the District near El Camino Real and Stanford Avenue (which equates to 667 additional housing units added to this district when combined with the 207 graduate student beds identified above)
- 666 faculty/staff units in the DAPER Development District, located at the edge of the district along El Camino Real
- 666 faculty/staff units in West Campus Development District located at the edge of the district along Sand Hill Road

Height and Density of the Additional Units

Because Stanford does not plan to build more on-campus housing than has been included in the 2018 General Use Permit application, Stanford has no conceptual plans for the densities or appearances of the additional units. The three sources of data that appear most useful in developing assumptions about the potential densities and appearances of additional housing units on the campus are (a) the requirement in the Stanford Community Plan (policy SCP-LU 3) that faculty/staff housing within the Academic Campus lands must be at least 15 units per acre; (b) the configuration and appearance of the recently approved Escondido Village Graduate Residences; and (c) the rough conceptual site planning Stanford has conducted for the Quarry Road housing sites to develop its proposal for the 2018 General Use Permit application.

Based on the Community Plan, it is reasonable to assume that new faculty/staff housing within the Quarry, West Campus, DAPER and/or East Campus Development Districts would be multi-family housing. This assumption also is consistent with the Community Plan policies promoting compact urban development.

As described in more detail below, the Escondido Village Graduate Students Residents project and Stanford's internal conceptual site planning for the proposed new housing at Quarry Road indicate that multi-family

housing buildings could range from about 50 feet tall to heights reaching 100 to 134 feet. Based on planning for Quarry Road, densities could range from about 40 to 80 units per acre. Again, Stanford has no plans to construct this housing. But absent any other information, these data sources could be used to provide an outer envelope.

Escondido Village Graduate Residences
The Escondido Village Graduate Residences project currently under construction includes four residential buildings that are 116 feet to the top of the roof and 134 feet to the top of the mansard. These buildings provide an example that could be used to estimate the possible heights of new graduate student housing and/or multi-family housing units assumed under the alternative.

Quarry Road Housing
In its 2018 General Use Permit application, Stanford proposes to construct 550 units on two sites in the Quarry Development District, at a combined density of approximately 40 units/acre (on 13.5 acres). While heights on both Quarry sites are unknown and might be taller than 50 feet, Stanford has assumed for conceptual planning purposes that this density could be achieved with buildings that are about 50 feet tall.

If twice as many units were constructed on these sites, the density would double and it is reasonable to assume that building heights also would double. This indicates that if a total of 1,100 housing units (550 from the application and 550 from the Full Housing Offset scenario) were assumed to be placed upon the combined 13 acres, the density would be approximately 80 units per acre. Building heights presumably would be 100 feet or more. This provides another example that could be used to estimate the possible outer range of the heights and densities of multi-family housing units assumed under the alternative.

<u>Other Considerations</u>
Doubling the housing proposed in the Quarry Development District would necessitate modifications to the El Camino Real Frontage Plan. The 2000 General Use Permit included a condition to adopt a plan to address height, setback, land use, vegetation, and landscaping on Stanford lands along El Camino Real. The height and setback requirements were to be as stringent or more stringent than those of Palo Alto (on the north side of El Camino Real).

Stanford completed and submitted this plan in 2008, and it was approved by Santa Clara County Architectural and Site Approval Committee. The plan recognizes two acceptable approaches for development within 100' of the Caltrans Right-of Way along El Camino Real:

(1) "High Density-urban manner": setback of 20' from R.O.W. and height limit of 50', or
(2) "Rural Buffer – 'The Farm'": setback of 50' from R.O.W. and height limit of 50'.

Development taller than 50 feet on the portion of the Quarry Sites that is within the area governed by the El Camino Frontage Plan would require changes to the Plan, as well as changes to the underlying County requirement that height and setbacks requirements in this location must be as stringent as those of Palo Alto.

Depending on their sizes and locations, placement of housing at the edges of the West Campus and DAPER Development Districts could displace existing recreation fields and detention basins located in these areas. Stanford does not have information about where these existing facilities could be relocated; however, it should be assumed that Stanford would need to continue to ensure that sufficient onsite detention exists to retain and regulate storm water flows and Stanford would want to maintain recreation fields for use by students and residents. The need to relocate these facilities could lead to requests to modify the Arboretum, other Campus

Open Space areas or lands outside the Academic Growth Boundary.

Placement of housing in the DAPER Development District also could necessitate modification to the El Camino Real Frontage Plan, similar to the modifications necessitated by doubling housing in the Quarry Development District.

Placement of additional housing in the East Campus Development District would necessitate redevelopment of existing sites within the Escondido Village area. The vacant sites at the edge of this District already were developed with faculty/staff housing under the 2000 General Use Permit.

DESCRIPTION OF "HALF OFFSET" HOUSING ALTERNATIVE

Number of Units

We understand that the County intends to evaluate a Half Offset Housing Alternative that would be capable of accommodating half the demand for offsite housing that was anticipated to occur during implementation of the 2018 General Use Permit. In other words, this Alternative would include the 3,150 beds/units proposed by the 2018 General Use Permit plus the following:

- 1,171 faculty/staff units; and
- 104 graduate student beds

The rationale for how the Draft EIR calculated anticipated population and then translated that population to demand for housing units is described above, under the Full Offset Housing Alternative.

Calculation of Resident Population

The Half Offset Alternative would add to the proposed project half as many additional residents compared to the Full Offset Alternative. **Table 3**, below, modifies Table 5.12-10 in the Draft EIR to show the incremental increase in the campus residential population that would occur under a Half Housing Offset Alternative, as well as the total residential population assumed under this alternative. The calculations are based on the same occupancy factors as were used in the Draft EIR (1.1 resident per graduate student bed and 2.57 residents per faculty/staff housing unit). Household members in faculty/staff units include children.

Table 3: Stanford Population Residing on Project Site with Half Offset Alternative – 2035

Affiliation	Residential Population Within Project Site Boundary 2018	Residential Population under 2018 GUP Within Project Site Boundary 2035	Change in Residential Population under Half Offset Alternative compared to Project	Total Population in 2035 (including 2018 GUP + Half Offset Alternative)
Undergraduate Students	6,617	8,317	0	8,317
Graduate Students	5,205	8,183	105	8,288
Non Student Spouses	660	894	9	903
Children	420	420	0	420
Faculty/Staff/Postdoctoral Students[a]	965	1,515	1,171	2,686
Other Family Members	1,471	2,335	1,840	4,175
Total	**15,338**	**21,664**	**3,125**	**24,789**

Source: Stanford University Land Use and Environmental Planning Office, in consultation with the Stanford University Residential and Dining Enterprises

Note: a) The number of units is calculated based on housing demand from increased faculty, staff, postdoctoral scholars and other workers. The actual occupancy of the units is unknown, and the assumptions used in the analysis are not intended to pre-judge who would live in the housing units. Rather, the units are assumed to be potentially occupiable by unspecified proportions of some or all of these groups.

Distribution of Student Beds and Housing Units

In discussing the Full Offset Housing Alternative, Stanford explained its view that there is no location on the lands within the Academic Growth Boundary that is appropriate for the additional faculty/staff housing contemplated by the Full Offset Alternative. The same rationale applies to the Half Offset Housing Alternative. As stated in the 2018 General Use Permit Project Objectives, Stanford prioritizes the use of campus lands within unincorporated Santa Clara County for academic and academic support facilities, student housing, and faculty housing. Stanford's application explains that the University focuses the use of its campus lands on student learning and discovery. Housing faculty and students on the campus directly enhances learning and research. While Stanford has constructed housing on its lands for staff and other Stanford affiliates, it has done so in other jurisdictions outside the campus lands.

The discussion of the Full Offset Housing Alternative also explains why, for purposes of the analysis, Stanford suggests that the County assume that the additional housing units contemplated by the alternative could be placed at the edges of the Quarry, West Campus, DAPER and/or East Campus Development Districts. That same logic also applies to the Half Offset Housing Alternative.

Distributing the housing units within the four districts is a bit more complicated. It is possible to assume that under the Half Offset Housing Alternative, the same amount of additional housing could be constructed in two of these four districts; however, it is also possible to assume the housing could be spread out between all four districts. Studying the same amount of housing in two districts simply would duplicate the analysis of the Full Offset Housing Alternative as to those two districts. For that reason, we instead suggest that the Response to Comments analysis assume the same amount of housing would be constructed in the Quarry District as is assumed under the Full Offset Housing Alternative (double the amount proposed by Stanford), and the remaining housing would be distributed equally among the three remaining districts. This approach recognizes that the Quarry sites are the only sites Stanford has proposed for housing, and these sites benefit from a close proximity to transit.

Under that logic, the 1,275 additional units contemplated by the Half Offset Alternative could be assumed to be located as follows:

- 550 faculty/staff units in Quarry Development District
- 104 graduate student units and 137 faculty/staff units in the East Campus Development District near El Camino Real and Stanford Avenue
- 242 faculty/staff units in the DAPER Development District along El Camino Real
- 242 faculty/staff units in the West Campus Development District along Sand Hill Road

Height and Density of the Additional Units

The same data points discussed under the Full Offset Housing Alternative would apply to the Half Offset Housing Alternative. In the absence of other information, it seems reasonable to assume the same envelope of density and building heights might occur, but on a smaller footprint. Therefore, we suggest that the County could make the same assumptions about the heights and densities of the additional housing units:

- Heights could range from 50 feet to up to 100-134 feet

- Densities could range from 40 to 80 units per acre

Other Considerations

The same other considerations as have been identified for the Full Offset Housing Alternative would also apply to the Half Offset Housing Alternative.

memorandum

date	June 2, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Jennifer Brown - ESA
subject	**ESA Peer Review of Stanford University 2018 General Use Permit EIR: Housing Alternative Park and Recreation Facilities Analysis**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Housing Alternative Park and Recreation Facilities Analysis* memo, prepared on March 19, 2018.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated the memo accordingly. The memo was revised by Stanford on June 1 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Housing Alternative Park and Recreation Facilities Analysis* memo is appropriate for use as reference in the EIR.

memorandum

date March 19, 2018, revised June 1, 2018

subject 2018 General Use Permit EIR: Housing Alternative Parks and Recreation Facilities Analysis

This Parks and Recreation Facilities technical report analyzes the potential recreation impacts of the two alternatives that the County has elected to study in response to comments on the Draft Environmental Impact Report for the 2018 General Use Permit, which would provide housing within the Academic Growth Boundary at the following levels:

- Full Offset Housing Alternative: Adds to the proposed project 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);

- Half Offset Housing Alternative: Adds to the proposed project 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

The standards for assessing the recreation impacts of the two housing alternatives include:

1. Whether the alternatives would require the construction or expansion of recreation facilities that might have an adverse effect on the environment;
2. Whether the alternatives would increase the use of existing neighborhood and regional parks or other recreation facilities such that substantial physical deterioration of the facilities would occur or be accelerated.

This technical analysis follows the methodologies established in the Parks and Recreation Facilities analysis submitted to Santa Clara County by Stanford on November 21, 2016, and updated in April 2017 in response to peer review comments from the County.

The April 2017 parks and recreation technical report explained that to address the first question, many jurisdictions, including the City of Palo Alto, use an “acres of park per 1,000 residents” target to determine whether a residential project will necessitate construction of new onsite parks to serve additional residents, which in turn could result in physical environmental effects. This technical report similarly compares the campus residential population anticipated to occur under the proposed 2018 General Use Permit and each of the two housing alternatives to the acreage of designated Campus Open Space, which function much like a park.

To address the second question, the April 2017 parks and recreation technical report assessed whether the increase in campus residents anticipated under the proposed 2018 General Use Permit would result in "substantial deterioration" to offsite public parks and recreation facilities. To address the potential for an increase in campus residents to result in substantial deterioration of nearby parks, Stanford surveyed its campus residents to determine current offsite park usage and to create a basis for projecting future offsite park use. This technical report similarly uses the Stanford survey data to project future offsite park use under each of the alternatives. The technical report then applies the same screening criteria used in the April 2017 parks and recreation technical report to determine whether the projected increase in offsite park use could cause or accelerate substantial physical deterioration of the offsite park and recreation facilities.

In the April 2017 technical report, Stanford also conducted a sensitivity analysis that conservatively considered the additive effect of any incidental use of nearby parks and recreation facilities associated with an increase in Stanford commuters that would occur under the Project (including faculty, staff, students and other population segments who do not live on campus). This technical report includes the same sensitivity analysis for the two housing alternatives.

Campus Resident Population

Table 1 below identifies the anticipated change in residential population under the 2018 General Use Permit, as well as the additional change in residential population due to the Full Offset Housing Alternative, and the Half Offset Housing Alternative.

For more details regarding population, please refer to the memo submitted to the County on March 2, 2018 describing the assumptions for the Housing Alternatives.

Table 1: Change in Stanford Campus Resident Population Under the Proposed Project and Housing Alternatives – 2035

Affiliation	Change in Campus Resident Population under proposed 2018 General Use Permit	Additional Change in Campus Resident Population under Full Offset Alternative	Additional Change in Campus Resident Population under Half Offset Alternative
Undergraduate Students	1,700	0	0
Graduate Students	918	210	105
Non Student Spouses	72	17	9
Children	0	0	0
Faculty/Staff/Postdoctoral Students	550	2,342	1,171
Other Family Members	864	3,678	1,840
Total	**4,104**	**6,247**	**3,125**

Source: Stanford University Land Use and Environmental Planning Office, in consultation with the Stanford University Residential and Dining Enterprises

Construction or Expansion of Recreation Facilities

Table 2 below demonstrates that for both housing alternatives, there would still be more than five acres of designated Campus Open Space per 1,000 campus residents, in excess of planning standards for residential communities. Therefore, neither of the housing alternatives would create a need for construction of new onsite park facilities.

Table 2: Campus Open Space Acreage per Resident

	2018 General Use Permit Fall 2035	Full Offset Alternative Fall 2035	Half Offset Alternative Fall 2035
Total Campus resident population	21,664	27,911	24,789
Designated Campus Open Space (approximate)	265	265	265
Ratio (acres per 1,000 residents, approximate)	12.2	9.5	10.7

Potential for Substantial Deterioration of Nearby Public Park and Recreation Facilities

The Draft EIR relied on the Turf Management Operations and Maintenance Guide for the Mall in Washington, D.C., to formulate a conservative screening threshold for physical deterioration of natural turf from increased park use, which is an increase of 12.5 daily visits per acre of parkland. To estimate the potential increase in visits to public park and recreation facilities in Palo Alto and Menlo Park, the Draft EIR relied on visit generation rates calculated from a campus-wide survey conducted in 2016.

Per the analysis presented in the Draft EIR, a combined daily visit generation rate is used for faculty, staff and postdocs. To the extent that Other Workers could be included in the campus resident population under the housing alternatives, their household size and park usage behavior are assumed to be the same as that of staff. Similar to the April 2017 technical report, spouses and dependents are assumed to have the same behavior as the primary affiliate.

Table 3 and **Table 4** below show the additional growth in daily visits by campus residents to the nearby public park and recreation facilities under the respective Full and Half Offset alternatives, and the resulting daily visits per acre to each park.

To repeat the technical analysis conducted for the Draft EIR, a sensitivity analysis for the new commuter populations resulting from the Full and Half Offset alternatives is also included in **Appendix B**.

Table 3: Estimated Growth in Usage of Public Park and Recreation Facilities by Campus Residents Under the Full Offset Housing Alternative

		Acres	Growth in Daily Visits under proposed 2018 General Use Permit	Daily Visits per Acre under proposed 2018 General Use Permit	Additional Growth in Daily Visits under Full Offset Alternative	Daily Visits per Acre under Full Offset Alternative*
Palo Alto						
Parks – Regional/District						
1	Foothills Park/Open Space Preserve	Total 1,400; Active 26.7	41	0.0; 1.5	132	0.1; 6.5
2	Baylands Nature Preserve	Total 1,940; Active 9.2	32	0.0; 3.5	108	0.1; 15.2
3	Pearson-Arastradero Preserve	Total 622; Active 6.2	27	0.0; 4.4	80	0.2; 17.3
Park and Recreation Facilities – Neighborhood						
4	Neighborhood parks in College Terrace (Cameron, Mayfield, Weisshaar, and Werry Parks)	4.4	37	8.4	127	37.3

20	Nealon Park	9.0	4	0.4	2	0.7
21	Jack W. Lyle Park	4.6	3	0.7	2	1.1

* Resulting daily visits per acre is calculated based on the total of growth in daily visits under the housing alternative, which includes the growth in campus residents under the proposed project plus the additional growth assumed for the Half Offset Housing Alternative.

As shown in **Table 3** and **Table 4** above, the increase in campus residents anticipated to occur under the Full Offset Housing Alternative would cause two regional/district parks (Baylands Nature Reserve and Pearson-Arastradero Preserve) and three neighborhood parks (College Terrace parks, Heritage Park, and Stanford Hills Park) to experience an increase of visits over the screening threshold of 12.5 daily visits per acre. The increase in

campus residents anticipated to occur under the Half Offset Housing Alternative would cause one neighborhood park (College Terrace parks) to experience an increase of visits over the screening threshold of 12.5 daily visits per acre. It is possible that significant deterioration could occur at each facility that would experience an increase in visits over the screening threshold. **Table 5**, below, summarizes the impacts of the alternatives.

Table 5: Summary of Potential Significant Impacts to Public Parks under Housing Alternatives

Park name	Total increase in daily visits	Park Acreage	Increase in daily visits per acre due to Project and Housing Alternative
Full Offset Housing Alternative			
Baylands Nature Preserve in Palo Alto	140	9.2 acres (active area)	15.2 (active area)
Pearson-Arastradero Preserve in Palo Alto	107	6.2 acres (active area)	17.3 (active area)
Neighborhood parks in College Terrace (Cameron, Mayfield, Weisshaar, and Werry Parks), Palo Alto	164	4.4 acres	37.3
Heritage Park in Palo Alto	26	2.01 acres	12.9
Stanford Hills Park in Menlo Park	44	3.1 acres	14.2
Half Offset Housing Alternative			
Neighborhood parks in College Terrace (Cameron, Mayfield, Weisshaar, and Werry Parks), Palo Alto	101	4.4 acres	23.0

In addition, the sensitivity analysis presented in **Appendix B** shows that if commuters are included in the analysis, the Half Offset Housing Alternative would exceed the screening criteria at the Pearson-Arastradero Preserve in Palo Alto.

The April 2017 parks and recreation analysis stated that when the visits to a park exceed the screening threshold, additional site specific analysis may be performed to determine whether the increase in visitors might require replacement of turf or other recreation facilities substantially in advance of their expected life cycles.

The guide for the potential for deterioration of natural turf, as referenced in the Draft EIR, is the Turf Management Operations and Maintenance Guide for the Mall in Washington, D.C., dated December 2012[1]. Page 16 of the Guide states that no recovery time is required for a minor event of less than 25 attendees (over a typical 2-panel acre of natural turf). A small event with 26 to 999 attendees requires three to five days of recovery time per event from March 15 to November 14. In Winter, from November 15 to March 14, only one such event is allowed per turf area.

There are turf areas at the following parks where the increase in visits from campus residents under the housing alternatives would exceed the screening threshold:

1. Neighborhood parks in College Terrace (Cameron, Mayfield, Weisshaar, and Werry Parks), in Palo Alto (in both the Full Offset and Half Offset)
2. Heritage Park in Palo Alto (in the Full Offset)
3. Stanford Hills Park in Menlo Park (in the Full Offset)

[1] https://www.nps.gov/nationalmallplan/Documents/TurfMgmt_OandM_Ch1_2013.pdf

As none of these parks has a reservation system in place to ensure adequate recovery time for the turf areas, impacts to turf areas at these parks under the housing alternatives could be significant. Mitigation for increased or accelerated physical deterioration to the turf areas could take the form of a contribution toward one-time turf replacement at these parks.

Per Appendix E of Tab 16 of the 2018 General Use Permit Application[2] (page 16.73), there are no turf areas at the Baylands Nature Preserve and the Pearson-Arastradero Preserve in Palo Alto. The calculation of active areas at this park was based on the length and average width of trails, mostly paved trails. However, increased visits to the trail system would not necessarily result in accelerated deterioration of the trails. According to research by the National Park Service, human-powered trail activities effectively have a minimal degradation on unsurfaced trails.[3] Therefore, the potential degradation of paved trails by an increased number of visitors at the Pearson-Arastradero Preserve and the Baylands Nature Preserve is even more minimal.

The timing of the mitigations may be based on the occupancy of housing units that trigger the recreational impacts linked to the respective housing alternatives. From Stanford's technical analysis submitted with the Project application, the proposed Project (3,150 units) does not trigger the mitigation measures.

As shown in Table 5 above, the College Terrace Parks are triggered under the half alternative, therefore the timing of the mitigation for those parks are triggered before occupying new housing that is beyond the Project (i.e. beyond 3,150 units).

As shown in Table 5 above, Heritage Park and Stanford Hills Park are only triggered beyond the half-offset alternative, therefore the therefore the timing of the mitigation for those parks are triggered before occupying new housing that is beyond the half-offset alternative (i.e. beyond 4,425 units).

The amount of the one-time contribution may be determined by the County of Santa Clara based on an estimate from an independent contractor. The payment should not be used for any purpose other than turf replacement at the specified parks.

[2] The calculation of turf areas and active areas is documented on Pages 16.73 and 16.74 of Appendix REC of the Draft EIR, Volume III.

[3] Marion and Olive. (2006). Assessing and Understanding Trail Degradation: Results from Big South Fork National River and Recreational Area. Retrieved from California Department of Parks and Recreation: https://www.parks.ca.gov/pages/1324/files/f10602%20marion&olive.pdf. The report found that hiking and biking do not result in significant soil loss or cause significant erosion to unsurfaced trails. While the study compared horse, all-terrain vehicle (ATV) use, hiking, and biking, and found that trails used by horses and ATVs were significantly more degraded than those used for hiking and biking, the report concluded that the type of use was a substantially greater determinant of trail degradation than the amount of use (Page 34). The report also references a past study which concluded that hiking and mountain biking do not make a significant amount of sediment available for erosion compared to the control (Page 5).

APPENDIX A: CALCULATIONS FOR PROJECTED VISITS BY CAMPUS RESIDENTS

Note: Projected population increase includes dependents. The additional population increases projected for the housing alternatives do not include the population increase projected under the 2018 General Use Permit. The additional increases projected for each housing alternative must be added to the increase projected under the proposed 2018 General Use Permit to arrive at the total increase that would occur under each alternative.

APPENDIX B: SENSITIVITY ANALYSIS – CALCULATIONS FOR FACULTY, STAFF AND STUDENT COMMUTERS, AND OTHER POPULATION SEGMENT COMMUTERS

To repeat the technical analysis conducted for the Draft EIR, a sensitivity analysis that identifies park visits by the commuter populations associated with the Full and Half Offset alternatives is also included.

There were no commuting undergraduates that resulted in visits to these offsite parks. The total for projected daily visits was calculated by adding the sum of future daily visits projected for graduates, faculty, staff and postdocs (rounded up to the nearest digit), and projected daily visits for Other Workers (also rounded up to the nearest digit). As Other Workers were not surveyed, the rate of visit for commuting Other Workers is assumed to be the same as that for commuting faculty, staff, and postdocs.

Table B1: Commuter Population

Affiliation	Growth in Commuter Population under proposed 2018 General Use Permit	Growth in Commuter Population under Full Offset Housing Alternative	Growth in Commuter Population under Half Offset Housing Alternative
Undergraduate	0	0	0
Graduate Students	282	72	177
Postdocs, Faculty, Staff, Other Workers	4,712	2,370	3,541
Total	**4,994**	**2,442**	**3,718**

18	Sharon Park	9.8	5	3	5	1.6
19	Sharon Hills Park	11.5	5	3	5	1.1
20	Nealon Park	9.0	4	2	8	1.6
21	Jack W. Lyle Park	4.6	3	2	5	2.2

** Resulting daily visits per acre is calculated based on the total of growth in daily visits under the housing alternative, which includes the growth in campus residents under the proposed project plus the additional growth assumed for the Half Offset Housing Alternative.

No additional regional/district parks exceed the screening threshold per the sensitivity analysis for the Full Offset Housing Alternative. Under the Half Offset Housing Alternative, only one additional regional/district park (Pearson-Arastradero Preserve) would exceed the screening threshold when the sensitivity analysis for commuters is applied.

memorandum

date	March 28, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Jennifer Brown - ESA
subject	**ESA Peer Review of Stanford University 2018 General Use Permit EIR: Housing Alternatives Student Generation Analysis**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Housing Alternatives Student Generation Analysis* memo on March 16, 2018.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated the memo accordingly. The memo was revised by Stanford on March 28 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor numerical and editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Housing Alternatives Student Generation Analysis* memo is appropriate for use as reference in the EIR.

memorandum

date March 28, 2018

to Steve Piasecki, County of Santa Clara

cc Brian Boxer, ESA; Paul Mitchell, ESA

from Catherine Palter, Stanford University; Lesley Lowe, Stanford University

subject 2018 General Use Permit EIR: Housing Alternatives Student Generation Analysis *Revised*

This technical report presents estimates for student generation resulting from each of the two housing alternatives that the County has elected to study in response to Draft EIR comments. The report also provides data to assess whether the number of students generated by the two alternatives could result in the need to construct a new school.

The technical data in this memo follow the methodologies established in the 2018 General Use Permit application (November 21, 2016) and the corresponding Draft Environmental Impact Report prepared by the County and its consultant (October 2017). See **Exhibit 1** for data responding to Palo Alto Unified School District's comments regarding the student generation rate used in the Draft EIR.

Housing Alternative Descriptions

The two housing offset alternatives that the County of Santa Clara has chosen to study in response to comments on the 2018 General Use Permit Draft EIR would provide housing within the Academic Growth Boundary at the following levels:

- Full Offset Housing Alternative: Adds to the proposed project 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- Half Offset Housing Alternative: Adds to the proposed project 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

Public School Student Generation

The housing alternatives would increase the residential population on campus, including school-age children, compared to the proposed project. The Draft EIR used student generation rates based on children per new multi-family faculty/staff household to estimate the number of school-age children that would be generated as a result of increased campus population under the proposed 2018 General Use Permit. Rates of 0.23 for elementary school, 0.12 for middle school, and 0.15 for high school were used, for a total student generation

rate of 0.50. These student generation rates used are consistent with the moderate student generation rates used by PAUSD's demographer, DecisionInsite, in its 2016 Residential Research Summary Report (PAUSD, 2016c).[1] Additional housing assumed under the Full Offset and Half Offset Alternatives would be multi-family units, similar to that analyzed under the proposed 2018 General Use Permit project, and therefore, the multi-family student generation rate would remain applicable.

Table 1 summarizes the estimated enrollment in PAUSD schools based on the proposed faculty/staff housing units from the proposed 2018 General Use Permit and each of the two housing alternatives. The Draft EIR estimated that the proposed 2018 General Use Permit would generate a total of 275 new PAUSD school-aged students (127 elementary school students; 66 middle school students; 82 high school students). Application of the same student generation rates to the alternatives results in an estimated generation of a total of 1,446 school-age students for the Full Offset Housing Alternative and a total of 861 school-aged students for the Half-Housing Offset Alternative.

Table 1: PAUSD Student Yield Under Housing Alternatives

Housing Alternative	Units	Yield Rate	PAUSD Students
Full Offset Alternative Units	2,342	0.50	1,171
Proposed 2018 GUP Units	550	0.50	275
Total Student Yield for Full Offset Alternative	2,892	0.50	1,446
Half Offset Alternative Units	1,171	0.50	586
Proposed 2018 GUP Units	550	0.50	275
Total Student Yield for Half Offset Alternative	1,721	0.50	861

As shown in **Tables 2 and 3**, the addition of 1,446 and 861 school-age students to the PAUSD for the two housing alternatives would be distributed over various grade levels and schools. Since buildout of either of the housing alternatives would occur incrementally over an approximate 17-year span, the school-age students generated by either housing alternative that would be added to PAUSD schools would also occur incrementally over this span.

Table 2: Full Offset Alternative PAUSD Student Yield Rate by Grade Level

Housing type	Units	Yield Rate	PAUSD Students
Elementary School	2,892	0.23	665
Middle School	2,892	0.12	347
High School	2,892	0.15	434
Total PAUSD Students	2,892	0.50	1,446

NOTES:

Student generation rates from PAUSD, *Residential Research Summary,* Fall 2016 prepared by DecisionInsite, November 2016.

[1] These rates are also consistent with the student generation rates used by the City of Palo Alto for multifamily housing in its Comprehensive Plan Update Supplement to the Draft EIR.

Table 3: Half Offset Alternative PAUSD Student Yield Rate by Grade Level

Housing type	Units	Yield Rate	PAUSD Students
Elementary School	1,721	0.23	396
Middle School	1,721	0.12	207
High School	1,721	0.15	258
Total PAUSD Students	1,721	0.50	861

NOTES:
Student generation rates from PAUSD, *Residential Research Summary,* Fall 2016 prepared by DecisionInsite, November 2016.

PAUSD Capacity Options

As described in Section 5.13 of the Draft EIR (starting on page 5.13-5), in the 2016/17 academic year, PAUSD middle school enrollment slightly exceeded PAUSD middle school capacity, whereas PAUSD elementary and high school enrollment were within PAUSD capacity. However, PAUSD projected in its 2016 demographic report a decline in elementary and middle school student enrollment through its planning horizon of 2026/27. Also, while PAUSD projected a near-term increase in its high school enrollment until 2020, it projected a decline in its high school enrollment thereafter through 2026/27 (PAUSD, 2016a,b,c). This projected decline in its enrollment could serve to lessen the effect of school-age children generated under the two housing alternatives such that sufficient capacity could be provided in the existing PAUSD schools.

PAUSD has provided comments on the Draft EIR indicating its latest 2018 moderate growth projections now show a slight increase in school enrollment over five years. The five-year increase assumes occupancy of 1,019 new residential units within the district.[2] It is not clear that this near-term increase in enrollment will occur, but even if school enrollment does increase such that more school capacity is needed, PAUSD would have multiple options to explore before building a new school. In addition to reactivating existing school sites owned by the District, such as Cubberley, Greendell and Garfield, the District also has several school properties currently leased to private school providers, such as Athena Academy, Pinewood School and the Ventura Site. PAUSD could also take advantage of schools that may be operating below capacity by redrawing lines designating which neighborhoods attend a given school or by adding modular classrooms. In October 2017, District representatives noted that there are currently 32 classrooms — the equivalent of two elementary schools — across all elementary campuses not being used as academic classrooms (Palo Alto Online, 2017). [3] Given the number of existing school sites owned by the District that are not presently used as public schools as well as the number of empty classrooms at existing elementary schools, construction of a new school appears to be speculative even with the increases in student generation that could occur under the two housing alternatives.

It should be noted that pursuant to California Government Code Sections 65995.5 through 65997, and related impact fees established by the PAUSD, school impact fees are charged for new residential and commercial

[2] See PAUSD 2018; Annual Enrollment Projection Report, DecisionInsite, submitted January 10, 2018. Note that in the Residential Research Summary attached to the Enrollment Projection Report, the authors acknowledge that over half of these units would not typically be included in enrollment projections. The Residential Research Summary states the demographers typically are interested only in active residential projects, meaning those that are currently under construction, have active entitlements, or are proposed for approval. However, in this case, the demographers included "possible projects" spread across the district in years 2021 and 2022. The authors state: "These supplementary projects are speculative in nature and their estimates were provided to Decisionsite by district staff." (Residential Research Summary, p. 1). Based on the tables appended to the Residential Research Survey, it appears that 541 of the assumed new housing units fit within this category.

[3] https://www.paloaltoonline.com/news/2017/10/11/board-majority-supports-elementary-improvements-but-others-have-questions,

development. Pursuant to Government Code section 65997, payment of school development fees is considered, for the purposes of CEQA, to mitigate in full any impacts to school facilities associated with a project.

memorandum

date	March 28, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Jennifer Brown - ESA
subject	**ESA Peer Review of Stanford University 2018 General Use Permit EIR: Solid Waste for Housing Alternatives**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Solid Waste for Housing Alternatives* memo, prepared on March 16, 2018.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda responding to ESA peer review comments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Solid Waste for Housing Alternatives* memo is appropriate for use as reference in the EIR.

memorandum

date March 16, 2018

to Steve Piasecki, County of Santa Clara

cc Brian Boxer, ESA; Paul Mitchell, ESA

from Catherine Palter, Stanford University

subject 2018 General Use Permit EIR: Solid Waste for Housing Alternatives

This technical report presents estimates for solid waste resulting from each of the two housing alternatives that the County has elected to study in response to Draft EIR comments.

Housing Alternative Descriptions
The two housing offset alternatives that the County of Santa Clara has chosen to study in response to comments on the 2018 General Use Permit Draft EIR would provide housing within the Academic Growth Boundary at the following levels:

- Full Offset Housing Alternative: Adds to the proposed project 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- Half Offset Housing Alternative: Adds to the proposed project 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

Solid Waste Demand Analysis
During the analysis for the additional solid waste demand of the two housing alternatives that the County has elected to study in response to comments on the Draft EIR for the 2018 General Use Permit, Stanford discovered two errors in the Draft EIR forecast methodology that essentially offset each other. The methodology created waste generation rates by dividing total waste by the number of students, faculty, and on- and off-campus staff as shown in **Table 1**. Landfill and recycling tonnages used to develop the per capita rate are presented in **Attachment A**.

Table 1: Draft EIR Landfill Generation Rate

	FY2015-16 (tons)	2015 Population [1]	Per capita rate (tons/person)
Total waste discharge	24,685	33,463	0.74
Landfill waste	8,945	33,463	0.27
Recyclables	15,740	33,463	0.47

[1] This population amount includes off-campus staff and does not include faculty members

The population number used in the Draft EIR to calculate the solid waste generation rates:

- Should not have included off-campus staff because the 2018 General Use Permit would not increase off-campus staff – off-campus staff are those staff who work in sites outside the core campus area in other jurisdictions not covered by the 2018 General Use Permit
- Should have included family members living on campus

Table 2 shows the corrected population amount, which creates the same waste generation rates as used in the Draft EIR.

Table 2: **Correct Generation Rate, Removing Off-Campus Staff and Adding Family Members**

	FY2015-16 (tons)	2015 Population [1]	Per capita rate (tons/person)
Total waste discharge	24,685	33,478	0.74
Landfill waste	8,945	33,478	0.27
Recyclables	15,740	33,478	0.47

[1] Derived from Tab 5 of 2018 General Use Permit (30,943 student, faculty and on-campus staff + 1,064 graduate student family members + 1,471 faculty/staff family members)

Full Offset Housing Alternative – estimated landfill demand

The waste generated at Stanford under the Full Offset Housing Alternative would increase due to an additional 3,695 family members on campus:

- 17 non-Stanford graduate student spouses
- 705 post-doc family members
- 2,973 faculty/staff family members

Half Offset Housing Alternative – estimated landfill demand

The waste generated at Stanford under the Half Offset Housing Alternative would increase due to an additional 1,849 family members on campus:

- 9 non-Stanford graduate student spouses
- 353 post-doc family members
- 1,487 faculty/staff family members

Table 3 presents the demand estimates of the alternatives to the proposed 2018 General Use Permit.

Table 3: Solid Waste Generation under the Proposed Project and Alternatives

	2018 General Use Permit (annual tons)	Full Offset Housing Alternative (annual tons)	Half Offset Housing Alternative (annual tons)
Total discards	6,381	9,115	7,749
Landfill waste	2,328	3,326	2,827
Recyclables	4,053	5,789	4,922

Memorandum

To	ESA: Paul Mitchell	Pages	1
For	Santa Clara County: David Rader and Kavitha Kumar		
Subject	Peer Review of Stanford's 2018 General Use Permit (GUP) – Housing Alternative Analysis		
From	AECOM: Nichole Seow and Greg Gleichman		
Date	May 7, 2018		

AECOM, as a member of the ESA team, is tasked with conducting a peer review of each transportation-related document submitted as part of the Stanford 2018 General Use Permit (GUP) application to verify that the documents follow generally-acceptable transportation planning practice, address the appropriate study area, and were conducted using methodologies that are clear and replicable.[1] This peer review memo represents AECOM's review of the revised '*Stanford University 2018 General Use Permit Housing Alternatives Transportation Impact Analysis'* dated April 2018, '*Stanford 2018 General Use Permit: Cumulative (2035) Conditions with Four-Lane Page Mill Road from I-280 to Junipero Serra Boulevard*' memo dated 4/23/2018 and '*Response to County Peer Review Comments on the Stanford 2018 General Use Permit Housing Alternatives TIA*' memo dated 4/23/2018.

AECOM finds the information provided sufficient in clarifying and addressing the 8 comments listed in our memo dated April 19, 2018. In addition, ESA has confirmed that comments #6 and #7 have been adequately addressed as well. We therefore have no further questions on the documents listed above.

[1] This language is from the scope of work in the AECOM contract for this project.

1. INTRODUCTION

The purpose of this transportation impact analysis (TIA) is to address the impacts of two alternatives to the 2018 General Use Permit on the surrounding transportation system external to the Stanford University campus including the roadways, transit service, pedestrian facilities, and bicycle facilities.

This section provides a description of the two Housing Alternatives, a description of the analysis scenarios, and an overview of the report organization.

1.1 HOUSING ALTERNATIVES DESCRIPTION

In December 2000, the Santa Clara County Board of Supervisors approved the current Stanford University General Use Permit (the "2000 General Use Permit") that defined the conditions of Stanford's planned growth and development. The 2000 General Use Permit authorized specified quantities of new academic and academic support facilities and housing units (units and/or student beds) within the campus. Stanford is about to reach the 2000 General Use Permit development limits in terms of both the academic and academic support space, and housing units. Therefore, Stanford is applying for an updated general use permit (the proposed 2018 General Use Permit) to establish the conditions for the next increment of campus growth.

Stanford proposes the following as a part of the 2018 General Use Permit:

- Construction of up to 2,275,000 additional net new square feet of academic and academic support uses,

- Construction of up to 3,150 net new housing units/beds, and
- Establishment of an approximately 2,000 parking space reserve that would be constructed only upon specified further County approval.

The two Housing Alternatives would retain all of the above uses, and would add more housing, as defined below:

- Full Offset Housing Alternative: 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 new housing units/ beds when combined with the 3,150 units/ beds that Stanford proposes to construct);
- Half Offset Housing Alternative: 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 new housing units/ beds when combined with the 3,150 units/ beds that Stanford proposes to construct).

1.1.1 ADDITIONAL DOCUMENTATION

The Stanford 2018 General Use Permit transportation analysis is a three-part document. Each document is identified below along with a brief description of the content included in the document and how it is referenced throughout the rest of this Housing Alternatives TIA.

1. **Stanford 2018 General Use Permit: Transportation Impact Analysis Part 1**
   Referenced as: 2018 General Use Permit: TIA Part 1
   This document describes Stanford University's trip generation, distribution, mode choice, and transportation demand management programs. It is incorporated by reference into the Housing Alternatives TIA.
2. **Stanford 2018 General Use Permit: SB 743 Vehicle Miles Traveled Analysis**
   Referenced as: 2018 General Use Permit: VMT Report
   This document presents the impacts of the Project in terms of criteria proposed by the California Governor's Office of Planning and Research to implement California State Law Senate Bill 743. This is a separate analysis and not directly referenced in the Housing Alternatives TIA.
3. **Stanford 2018 General Use Permit: Transportation Impact Analysis Part 2**
   Referenced as: 2018 General Use Permit: TIA Part 2
   This document describes the regulatory setting, significance criteria and analysis methodology, Existing Conditions, Background (2018) Conditions, Cumulative (2035) Conditions, and all impacts for the proposed 2018 General Use Permit. This document is incorporated by reference in the Housing Alternatives TIA. In particular, the following chapters of TIA Part 2 can be referenced as needed by reviewers of this document; since they do not change for the purposes of evaluating the Housing Alternatives, they are not repeated in this document:
   Chapter 1, Section 1.2: Study Area
   Chapter 2: Regulatory Setting
   Chapter 3: Significance Criteria and Analysis Methods

Chapter 4: Existing Conditions

Chapter 5: Traffic Forecasting (except for the Housing Alternatives Trip Generation and Distribution, which is provided in Chapter 2 of this document)

The following chapters of TIA Part 2 contain the findings of the 2018 General Use Permit TIA analysis, and key results from these chapters is summarized in Chapters 3, 4 and 5 of this document, to facilitate a comparison of the Housing Alternatives' impacts to the impacts of the proposed 2018 General Use Permit.

Chapter 6: Background (2018) Conditions: No Project and With Project

Chapter 7: Cumulative (2035) Conditions: No Project and With Project[1]

Chapter 8: Transportation Impact Assessment

This study supplements the 2018 General Use Permit: Transportation Impact Analysis Part 2 by applying the same methodology to the two Housing Alternatives. Fehr & Peers also has prepared an SB 743 Vehicle Miles Traveled Analysis for the Housing Alternatives.

1.2 ANALYSIS SCENARIOS

This study addresses the Housing Alternatives' impacts on the roadway system and the adjacent bicycle, pedestrian, and transit networks. Only the topics required for the CEQA impact analysis, consistent with the Santa Clara County VTA Transportation Impact Analysis Guidelines, are included in this report; however, the Neighborhood Street Impacts analysis is also included to provide a comparison to the proposed Stanford 2018 General Use Permit Project analysis in TIA Part 2. Intersection and freeway operations were evaluated during the weekday peak hours within the morning (7:00 AM to 10:00 AM) and evening (4:00 PM to 7:00 PM) peak periods for the scenarios listed below. Intersection turning movement counts may be found in Appendix B of TIA Part 2. The exact peak hour within each peak period varies by study intersection, and each intersection's peak hour was evaluated in this analysis. For example, one intersection might have a peak hour of 7:15 AM to 8:15 AM and another might have a peak hour of 7:45 AM to 8:45 AM.

- ***Existing Conditions*** uses existing volumes obtained from new traffic counts and current roadway geometries.
- ***Background (2018) Conditions*** uses the VTA-C/CAG[2] 2020 travel demand forecasting model to determine local growth as assumed by fall 2018, and assumes completion of the existing 2000 General Use Permit academic and academic support development. Because the Escondido Village Graduate

[1] Note that the Cumulative (2035) No Project and With Project analysis results for the proposed 2018 General Use Permit have been updated to reflect the County's direction to assume that Page Mill Road between I-280 and Junipero Serra Boulevard/Foothill Expressway remains four lanes in 2035. These updated results are reported in this Housing Alternatives TIA, for comparison to the Housing Alternatives Cumulative (2035) conditions (which also reflect the four-lane assumption).

[2] C/CAG = San Mateo County City/County Association of Governments. C/CAG is the congestion management agency for San Mateo County.

Student Residences project will not be occupied by 2018, this project is not included in Background (2018) Conditions.

- ***Background (2018) with Full Offset Housing Alternatives Conditions*** adds the full buildout of the Full Offset Housing Alternative to the Background (2018) Condition. Herein referred to as "Background (2018) with Full Offset Housing Alternative".
- ***Background (2018) with Half Offset Housing Alternative Conditions*** adds the full buildout of the Half Offset Housing Alternative to the Background (2018) Condition. Herein referred to as "Background (2018) with Half Offset Housing Alternative".
- ***Cumulative (2035) Conditions*** uses the VTA-C/CAG 2040 travel demand forecasting model to determine future year volumes assumed in Year 2035, the estimated duration for the 2018 General Use Permit. The Cumulative (2035) Conditions scenario includes the Escondido Village Graduate Student Residences project because the project will be built and occupied prior to 2035.
- ***Cumulative (2035) with Full Offset Housing Alternative Conditions*** adds the full buildout of the Full Offset Housing Alternative to the Cumulative Condition. Herein referred to as "Cumulative (2035) with Full Offset Housing Alternative".
- ***Cumulative (2035) with Half Offset Housing Alternative Conditions*** adds the full buildout of the Half Offset Housing Alternative to the Cumulative Condition. Herein referred to as "Cumulative (2035) with Half Offset Housing Alternative".

1.3 REPORT ORGANIZATION

This report is divided into four additional chapters as described below:

- **Chapter 2 – Housing Alternatives Trip Generation and Distribution** presents the trip generation and distribution for the Full Offset and Half Offset Housing Alternatives
- **Chapter 3 – Background (2018) Conditions** presents the transportation operations with and without the Housing Alternatives under Background (2018) Conditions.
- **Chapter 4 – Cumulative (2035) Conditions** presents the transportation operations with and without the Housing Alternatives under Cumulative (2035) Conditions.
- **Chapter 5 –Transportation Impact Assessment** presents the transportation impacts of the Housing Alternatives based on the CEQA significance criteria for the study intersections, freeway segments, and neighborhood streets and provides mitigation measures to address the Housing Alternatives' impacts under Background (2018) and Cumulative (2035) Conditions. This chapter includes any potential secondary impacts to the transit service, bicycle, and pedestrian facilities. Any safety or emergency access impacts are also discussed.

2. HOUSING ALTERNATIVES TRIP GENERATION AND DISTRIBUTION

This chapter describes the trip generation estimates and trip distribution for the two Housing Alternatives. The Housing Alternatives include all development proposed for the 2018 General Use Permit, plus the following amounts of additional housing:

- Full Offset Housing Alternative: 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 new housing units/ beds when combined with the 3,150 units/ beds that Stanford proposes to construct);
- Half Offset Housing Alternative: 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 new housing units/ beds when combined with the 3,150 units/ beds that Stanford proposes to construct).

2.1 TRIP GENERATION

The trip generation was estimated for both Housing Alternatives using:

- The Stanford resident peak hour trip generation rates in the TIA Part 1, and
- Stanford commuter peak hour trip generation rates that were developed in February 2017, to respond to peer review comments during the review process for TIA Part 1.

Both of these sets of trip generation rates were previously peer-reviewed by the County's consultants, AECOM and ESA, in connection with preparation of the Draft EIR for the 2018 General Use Permit. The rates are presented in **Table 2-1**. It should be noted that the commuter trip generation rate is the average rate per Stanford commuter, which accounts for the fact that only a portion of the commuters drive to campus. The residential rates are the measured trip generation rates on a per-bed or per-unit basis at Stanford student and faculty/staff housing sites. Residential rates include trips by Stanford affiliates as well as spouses and other household members.

TABLE 2-1: TRIP GENERATION RATES

Trip Type	AM Peak Hour			PM Peak Hour Trips		
	In	Out	Total	In	Out	Total
Commuter (trips/Stanford affiliate living off campus)	0.096	0.041	0.137	0.051	0.084	0.135
Student Resident (trips/bed)	0.028	0.037	0.065	0.077	0.066	0.143
Faculty/Staff Resident (trips/unit)	0.150	0.280	0.430	0.260	0.190	0.450

Source: Fehr & Peers, March 2018

The trip generation calculations for the Full Offset and Half Offset Housing Alternatives are included in **Appendix A**. **Table 2-2** presents the trip generation for the proposed Project, for reference, and **Table 2-3** summarizes the commute trips eliminated, residential trips added, and the net change, for each Housing Alternative.

Under the Full Offset Housing Alternative, 2,342 more faculty/staff units are assumed to be constructed on the campus, as compared to the proposed 2018 General Use Permit. These units would reduce the population that otherwise would commute to the campus under Project conditions by 2,342 individuals.[3] Therefore, the trip generation estimation process starts by subtracting from Project conditions the commuters who would no longer commute to campus by multiplying 2,342 by the commuter trip generation rate and showing that result as a negative number. The trips associated with 2,342 new faculty/staff housing units are then added to that number to generate a net change in faculty/staff trips compared to Project conditions. The same process was used for the 210 graduate students who are assumed to be housed in new graduate student beds (note that the number of graduate students assumed to occupy the new beds incorporates an assumption for two-student couples).

[3] The trip generation calculations are based on the following uniform assumptions for all multi-family housing units: (1) the trip generation rates associated with all new multi-family housing unit are the same as the surveyed trip rates per faculty/staff housing unit that were presented in the TIA Part 1; and (2) for purposes of deducting trips by commuters moving on to campus, the analysis conservatively assumes that each new multi-family housing unit would house one Stanford affiliate plus that affiliate's other household members.

Under the Half Offset Housing Alternative, 1,171 more faculty/staff units are assumed to be constructed on the campus, as compared to the proposed 2018 General Use Permit. We assume this would reduce the population that otherwise would commute to the campus under Project conditions by 1,171 individuals. Again, the trip generation estimation process starts by subtracting from Project conditions the commuters who would no longer commute to campus by multiplying 1,171 by the commuter trip generation rate and showing that result as a negative number. The trips associated with 1,171 new faculty/staff housing units are then added to that number to generate a net change in faculty/staff trips compared to Project conditions. The same process was used for the 105 graduate students who are assumed to be housed in new graduate student beds (incorporating a factor for two-student couples).

TABLE 2-2: 2018 GENERAL USE PERMIT VEHICLE TRIP GENERATION ESTIMATES

Generator	AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total
Non-Residential Trips (Commuters, visitors, others)	598	178	776	257	502	759
Resident Trips	153	250	403	343	276	619
Total Trips	751	428	1,179	600	779	1,379

Source: TIA Part 2, Table 5-5 (condensed).

TABLE 2-3: HOUSING ALTERNATIVES TRIP GENERATION SUMMARY (COMPARED TO PROPOSED 2018 GENERAL USE PERMIT)

Trip Type	AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total
Full Offset Housing Alternative						
Commuter Trips Eliminated	(244)	(106)	(350)	(130)	(213)	(344)
Resident Trips Added	357	664	1,021	625	459	1,084
Net Change Compared to Project	113	558	671	495	246	740
Half Offset Housing Alternative						
Commuter Trips Eliminated	(122)	(53)	(175)	(65)	(107)	(172)
Resident Trips Added	179	332	510	313	229	542
Net Change Compared to Project	56	279	335	247	123	370

Source: Fehr & Peers, 2018.

Compared to the proposed 2018 General Use Permit, the Housing Alternatives would generate a net increase in trips entering and leaving campus during the peak hours, due to the higher vehicle trip generating characteristics of faculty/staff residential units as compared to Stanford commuters. These trips would be in addition to those of the proposed project. The faculty/staff residential units could house singles,

couples and families, generating the full range of housing-related trips by vehicle and other modes. These residential trips would have a different distribution than the commuter trips, as described below.

2.2 TRIP DISTRIBUTION

Figures 5-1 and 5-2 in TIA Part 2 present the commuter and resident trip distribution patterns used in the Stanford 2018 General Use Permit traffic impact analysis. The commuter distribution is based on Stanford off-campus resident locations, and the resident distribution is based on census data for the census tracts including the Stanford campus residential areas. A detailed description of the development of the trip distribution patterns is provided in TIA Part 1. These distribution assumptions have been peer-reviewed by the County's consultants, AECOM and ESA. These distribution patterns were used to distribute and assign the commuter trip reductions and residential bed/unit trip additions to the roadway network. The campus locations for the residential units that would be added to the proposed Project by the Housing Alternatives are listed below. These locations are reflected in the trip assignments.

Full Offset Housing Alternative Development District Allocations

- 550 additional faculty/staff units in Quarry Development District (for a total of 1,100 faculty/staff units in the Quarry Development District when added to the 550 units proposed by Stanford in its 2018 General Use Permit application)
- 666 faculty/staff units in DAPER Development District
- 666 faculty/staff units in West Campus Development District
- 207 additional graduate student beds and 460 faculty/staff units in East Campus Development District (for a total of 1,807 student beds and 460 faculty/staff units when added to the 1,600 student beds proposed by Stanford in its 2018 General Use Permit application)

Half Offset Housing Alternative Development District Allocations

- 550 additional faculty/staff units in Quarry Development District (for a total of 1,100 faculty/staff units in the Quarry Development District when added to the 550 units proposed by Stanford in its 2018 General Use Permit application)
- 242 faculty/staff units in DAPER Development District
- 242 faculty/staff units in West Campus Development District
- 104 additional graduate student beds and 137 faculty/staff units in East Campus Development District (for a total of 1,704 student beds and 460 faculty/staff units when added to the 1,600 student beds proposed by Stanford in its 2018 General Use Permit application)

Both Housing Alternatives would contribute more trips to the local area when compared to the proposed Project.

3. BACKGROUND (2018) CONDITIONS: NO PROJECT AND WITH HOUSING ALTERNATIVES

This section presents the operations of the surrounding transportation system under Background (2018) No Project and Background (2018) With Housing Alternatives Conditions. Background (2018) No Project Conditions are defined as conditions without the 2018 General Use Permit. Traffic volumes for Background (2018) No Project Conditions are based on forecasts from the VTA traffic model, including ABAG 2020 land use projections, traffic generated by approved development projects, and the completion of the 2000 General Use Permit (except for the Escondido Village Graduate Residences project), as described in Chapter 5 of TIA Part 2, as well as Chapter 2 of this Housing Alternatives TIA.

Background (2018) With Housing Alternatives Conditions are defined as Background (2018) No Project Conditions plus traffic generated by build-out of each Housing Alternative.

3.1 BACKGROUND (2018) INTERSECTION ANALYSIS

Level of service calculations were prepared using the TRAFFIX 8.0 software to evaluate signalized and unsignalized intersection operations under Background (2018) Conditions. The TRAFFIX 8.0 software uses the *2000 HCM* methodology and is consistent with VTA TIA guidelines. The intersection volumes are shown in **Appendix B** and results of the LOS analysis are summarized in **Table 3-1**. The corresponding LOS calculation sheets are included in **Appendix C** and peak hour signal warrant calculations for unsignalized intersections that are significantly impacted are provided in **Appendix D**.

The projected increases in critical delay and critical volume-to-capacity (V/C) ratios between the Background (2018) No Project, Background (2018) With 2018 General Use Permit and Background (2018) With Housing Alternatives Conditions are provided in **Table 3-1**. Critical delay represents the delay associated with the critical movements of the intersection, or the movements that require the most "green time" and have the greatest effect on overall intersection operations. Housing Alternatives' impacts are identified by comparing Background (2018) No Project to Background (2018) With Housing Alternatives Conditions. Significant impacts are identified based on the impact criteria presented in Chapter 3 of TIA Part 2, which include changes in the LOS from an acceptable to an unacceptable level or changes in critical delay and critical V/C ratios for intersections operating unacceptably.

In the Background (2018) With Full Offset Housing Alternative analysis and in the Half Offset Housing Alternative analysis, significant impacts are identified at the same five intersections, in the same peak hours:

- Intersection #2: I-280 NB Off-Ramp/Sand Hill Road (AM peak hour)
- Intersection #13: I-280 SB Off-Ramp/Page Mill Road (AM and PM peak hours)
- Intersection #17: Junipero Serra Blvd./Foothill Expwy./Page Mill Road (AM and PM peak hours)
- Intersection #30: Foothill Expressway/Arastradero Road (PM peak hour)
- Intersection #58: Alma Street/Charleston Road (PM peak hour)

These same five intersections would experience significant impacts under the proposed 2018 General Use Permit. The TIA Part 2 identified one additional intersection with a significant impact under the proposed 2018 General Use Permit at Intersection #31, Foothill Expressway/ San Antonio Road. However, that result was due to a volume error that has since been corrected. Therefore, the Housing Alternatives would result in significant impacts at the same intersections as the proposed 2018 General Use Permit.

Generally, at the study intersections located closest to the campus, the Housing Alternatives would increase congestion compared to the proposed Project. At the study intersections located farther from the campus, the Housing Alternatives would reduce congestion by a small degree compared to the proposed Project because peak hour, peak direction residence-based trips are assumed to start and end at destinations closer to the Stanford campus as compared to peak hour, peak direction commute trips. When compared to the proposed Project, the Full Offset Alternative would add approximately 200 to 220 peak hour trips to intersections directly adjacent to the campus along El Camino Real and between 30 to 130 peak hour trips to intersections that border the campus along Sand Hill Road and Junipero Serra Boulevard. The Half Offset Alternative would add approximately 110 peak hour trips to the same El Camino Real intersections and between 10 to 60 peak hour trips to other bordering intersections. Overall, the Housing Alternatives would not reduce significant effects of the proposed 2018 General Use Permit under 2018 conditions.

At times, intersections may show a reduction in average delay with the addition of Housing Alternatives traffic, which is counter-intuitive. However, the average delay values in the table are weighted averages. Weighted average delays will be reduced when traffic is added to a movement that has a low delay under

existing conditions.[4] Conversely, relatively small volume increases to movements with high delays can substantially increase the weighted average delay.

Mitigation measures to address these impacts are presented in Chapter 5.

[4] For example, if there is one movement with 10 vehicles and a delay of 100 seconds and another movement with 400 vehicles and 10 seconds of delay, the weighted average delay is calculated as (100 seconds X 10 vehicles + 10 seconds X 400 vehicles) / 410 vehicles = 12.2 seconds per vehicle. Now if 100 vehicles are added to the movement with 10 seconds of delay, the weighted average delay is calculated as (100 seconds X 10 vehicles + 10 seconds X 500 vehicles) / 510 vehicles = 11.8 seconds per vehicle. The weighted average delay improves, even though more vehicles are added.

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

*Indicates unsignalized intersection.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
   (SC CMP) – CMP intersection in Santa Clara County
   (SM CMP) – CMP intersection in San Mateo County
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Background (2018) With Proposed 2018 General Use Permit presents the results from TIA Part 2 as it was included in the Draft EIR. These results are provided for comparison purposes only.
5. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
6. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
7. Change in critical volume to capacity ratio between Background (2018) and Background (2018) With Project and Background (2018) With Housing Alternatives Conditions. This ratio is not applicable for side-street stop controlled intersections and is denoted by "N/A".
8. Change in average critical movement delay between Background (2018) and Background (2018) With Project and Background (2018 With Housing Alternatives Conditions. This ratio is not applicable for side-street stop controlled intersections and is denoted by "N/A".
9. The US 101 / Willow Road interchange reconfiguration is estimated to be constructed by 2020, and is denoted by "N/A" under Existing and Background (2018) Conditions.
10. A signal warrant is not met for this intersection.

3.2 BACKGROUND (2018) FREEWAY SEGMENT ANALYSIS

The future operations of freeway mainline segments in Santa Clara County and San Mateo County are evaluated using V/C ratios, with the volume-to-capacity ratio greater than 1.0 indicating the vehicle demand exceeds capacity. Freeway volumes for the Background (2018) No Project and Background (2018) With Project and Background (2018) With Housing Alternatives cases were developed as described in Chapter 5 of TIA Part 2, as well as Chapter 2 of this TIA. As described in Chapter 3 of TIA Part 2, a Santa Clara County VTA freeway segment impact under Background (2018) with Housing Alternatives Conditions is determined to occur when:

- the addition of traffic causes a freeway segment volume-to-capacity ratio to exceed 1.0, or
- the Housing Alternative increases traffic demand on a freeway segment already operating at a V/C greater than or equal to 1.0 by an amount equal to one percent or more of the segment capacity.

Freeway segments in San Mateo County also abide by these impact criteria. Plus, an impact may occur if the Housing Alternative causes the freeway segment V/C ratio to increase by one (1.0) percent on a segment already operating at a V/C greater than or equal to 1.0.

Under Background (2018) With Full Offset Housing Alternative Conditions, six freeway segments would meet the significance criteria, which is two more than under Background (2018) With Project Conditions.

- Northbound State Route 85
    - South De Anza Boulevard to Stevens Creek Boulevard (AM and PM* peak hours);
    - Stevens Creek Boulevard to I-280 (AM peak hour);
- Southbound State Route 85
    - Stevens Creek Boulevard to South De Anza Boulevard (PM peak hour);
    - South De Anza Boulevard to Saratoga Avenue (PM peak hour)*;
- Northbound Interstate 280
    - Magdalena Avenue to El Monte Road (AM peak hour)*;
- Southbound Interstate 280
    - El Monte Road to Magdalena Avenue (PM peak hour).

* = Impact would not occur under Background (2018) With Project Conditions.

In addition, as shown above, the Full Offset Housing Alternative would extend the impact to Northbound State Route 85 from Stevens Creek Boulevard to South De Anza Boulevard to both the AM and PM peak hours, while the proposed 2018 General Use Permit would only result in a significant impact to this freeway segment in the AM peak hour.

Under Background (2018) With Half Offset Housing Alternative Conditions, six freeway segments would meet the significance criteria, which is two more than under Background (2018) With Project Conditions.

- Northbound State Route 85
    - South De Anza Boulevard to Stevens Creek Boulevard (AM peak hour);
    - Stevens Creek Boulevard to I-280 (AM peak hour);
- Southbound State Route 85
    - Stevens Creek Boulevard to South De Anza Boulevard (PM peak hour);
    - South De Anza Boulevard to Saratoga Avenue (PM peak hour)*;
- Northbound Interstate 280
    - Magdalena Avenue to El Monte Road (AM peak hour)*;
- Southbound Interstate 280
    - El Monte Road to Magdalena Avenue (PM peak hour).

* = Impact would not occur under Background (2018) With Project Conditions.

Appendix E includes the freeway V/C ratio calculations, levels of service, and impact assessment.

Compared to the proposed 2018 General Use Permit Conditions, both Housing Alternatives would add two new freeway segments that meet the significance criteria. In addition, the Full Offset Housing Alternative would extend the impact to Northbound State Route 85 from Stevens Creek Boulevard to South De Anza Boulevard to both the AM and PM peak hours, while the proposed 2018 General Use Permit would only result in a significant impact to this freeway segment in the AM peak hour. Overall, the Housing Alternatives would not reduce the significant impacts of the proposed 2018 General Use Permit. See Chapter 5: Transportation Impact Assessment, for further discussion on freeway segment impacts and mitigations.

3.3 BACKGROUND (2018) TRANSIT DELAY ANALYSIS

The Housing Alternatives would add traffic along major transit corridors throughout the Cities of Palo Alto and Menlo Park, which could affect operations of VTA and SamTrans bus routes. The bus routes evaluated along with the methodology for estimating this delay is described in Chapter 3, Section 6 (Transit Service Analysis Methods) in the TIA Part 2. The additional delay to transit service in the area due to implementation of the Housing Alternatives is shown in **Table 3-2**. **Appendix F** contains the calculation summary for each transit route.

Based on the delay assessment, the Housing Alternatives would not add substantial delays relative to the total route travel time to any of the transit routes assessed. For the Background (2018) With Full Offset Housing Alternative scenario, the additional delay would be less than 30 seconds on all but three of the routes and less than 60 seconds on all but two of the routes. For the Background (2018) With Half Offset Housing Alternative scenario, the additional delay would be less than 30 seconds on all but one of the routes and less than 60 seconds on all of the routes. The longest-delay result, 91 seconds on the Dumbarton

Express 1 eastbound in the PM for the Background With (2018) Full Offset Housing Alternative conditions, constitutes three percent of the total travel time on that route.

The above results can be compared to the Background (2018) With Project analysis, in which the Project traffic would add delays of less than 25 seconds on all routes, as shown in Table 3-2.

TABLE 3-2: BACKGROUND (2018) WITH HOUSING ALTERNATIVES TRANSIT ROUTE DELAY[1]

Route		Direction	Peak Hour	Additional Route Average Delay with Housing Alternatives (seconds)[2]

Note:

1. Transit delay is calculated by summing each transit route movements through the study intersections. Some movements may experience large increases or decreases in delay as a result of the analysis software (Traffix 8.0) redistributing green time for each phase.

2. The Project was not considered to have a measureable change in overall transit delay if the increase in travel time was less than five seconds or the travel time improved slightly (due to changes in signal timing, critical movement changes, etc.).

3. Background (2018) With Proposed 2018 General Use Permit presents the results from TIA Part 2 as it was included in the Draft EIR. These results are provided for comparison purposes only.

Source: Fehr & Peers, April 2018.

3.4 BACKGROUND (2018) BICYCLE AND PEDESTRIAN QUALITY OF SERVICE ANALYSIS

Pedestrian and bicycle QOS analysis is presented in Chapter 5, as the analysis depends on the traffic mitigation measures proposed.

4. CUMULATIVE (2035) CONDITIONS: NO PROJECT AND WITH HOUSING ALTERNATIVES

This section presents the operations of the surrounding transportation system under Cumulative (2035) No Project and Cumulative (2035) With Housing Alternatives Conditions. Cumulative (2035) No Project Conditions are defined as conditions without the 2018 General Use Permit. Traffic volumes for Cumulative (2035) No Project Conditions are based on forecasts from the VTA traffic model, including ABAG 2040 land use projections, traffic generated by approved development projects, and the completion of the 2000 General Use Permit (including the Escondido Village Graduate Residences project), as described in Chapter 5 of TIA Part 2, and Chapter 2 of this Housing Alternatives TIA. A list of planned transportation improvements within the study area may be found in Appendix I of TIA Part 2.

Cumulative (2035) With Housing Alternatives Conditions are defined as Cumulative (2035) No Project Conditions plus traffic generated by each Housing Alternative.

4.1 CUMULATIVE (2035) INTERSECTION ANALYSIS

Level of service calculations were conducted using the TRAFFIX 8.0 software to evaluate signalized and unsignalized intersection operations under Cumulative (2035) No Project and Cumulative (2035) With Housing Alternatives Conditions. The TRAFFIX 8.0 software uses the *2000 HCM* methodology, per the VTA TIA Guidelines. The intersection volumes are shown in **Appendix B** and results of the LOS analysis are

summarized in **Table 4-1**. The corresponding LOS calculation sheets are included in **Appendix C** and the peak hour signal warrants for intersections that are significantly impacted are provided in **Appendix D**.

The results for Existing Conditions are included in **Table 4-1** for comparison purposes, along with the projected increases in critical delay and critical volume-to-capacity (V/C) ratios between the Cumulative (2035) No Project and Cumulative (2035) With Proposed 2018 General Use Permit and Cumulative (2035) With Housing Alternatives Conditions.

The results for the Cumulative (2035) No Project and Cumulative (2035) With Proposed 2018 General Use Permit conditions have been updated since publication of TIA Part 2 and the Draft Environmental Impact Report to correct the assumed lane configuration on Page Mill Road under Cumulative (2035) Conditions. Modeling conducted for TIA Part 2 used a 6-lane configuration that VTA included in its 2040 traffic model. Subsequently, VTA staff indicated that inclusion of the 6-lane configuration had been an error on the part of VTA. The updated results are based on modeling that assumes the existing 4-lane configuration for Page Mill Road. The updated modeling followed the same process outlined in TIA Part 2, Chapter 5, and is described in the Fehr & Peers memorandum *Stanford 2018 General Use Permit: Cumulative (2035) Conditions with Four-Lane Page Mill Road from I-280 to Junipero Serra Boulevard* (March 22, 2018).

Critical delay represents the delay associated with the critical movements of the intersection, or the movements that require the most "green time" and have the greatest effect on overall intersection operations. Housing Alternatives impacts are identified by comparing Cumulative (2035) No Project with Cumulative (2035) With Housing Alternatives Conditions. Significant impacts are identified based on the impact criteria stated earlier, which include changes in the LOS from an acceptable to an unacceptable level or changes in critical delay and critical V/C ratio for intersections operating unacceptably.

As shown in **Table 4-1**, in the Cumulative (2035) With Full Offset Housing Alternative analysis, significant impacts are identified at 23 intersections:

- Intersection #2: I-280 NB Off-Ramp/Sand Hill Road (AM peak hour)
- Intersection #17: Junipero Serra Blvd./Foothill Expressway/Page Mill Road (AM and PM peak hours)
- Intersection #19: Hanover Street/Page Mill Road (AM peak hour)
- Intersection #20: El Camino Real/Page Mill Road/Oregon Expressway (AM and PM peak hours)
- Intersection #21: Middlefield Road/Oregon Expressway (AM peak hour)
- Intersection #29: Foothill Expressway/Hillview Avenue (AM peak hour)
- Intersection #30: Foothill Expressway/Arastradero Road (AM and PM peak hours)
- Intersection #31: Foothill Expressway/San Antonio Road (PM peak hour)
- Intersection #32: Foothill Expressway/El Monte Avenue (AM peak hour)
- Intersection #33: Foothill Expressway/Springer Road-Magdalena Avenue (AM peak hour)

- Intersection #34: Bowdoin Street/Stanford Avenue (PM peak hour)*
- Intersection #37: El Camino Real/Encinal Avenue (PM peak hour)
- Intersection #38: El Camino Real/Valparaiso Avenue (PM peak hour)
- Intersection #41: El Camino Real/Ravenswood Road (PM peak hour)
- Intersection #48: El Camino Real/Embarcadero Road (PM peak hour)
- Intersection #56: Alma Street/ Hamilton Avenue (PM peak hour)
- Intersection #58: Alma Street/Charleston Road (AM* and PM peak hours)
- Intersection #59: Middlefield Road/Marsh Road (AM peak hour)
- Intersection #63: Middlefield Road/ Lytton Avenue (PM peak hour)
- Intersection #66: Middlefield Road/Embarcadero Road (AM and PM peak hours)
- Intersection #69: Middlefield Road/ Charleston Road (PM peak hour)*
- Intersection #89: Central Expressway/Castro Street-Moffett Boulevard (PM peak hour)**
- Intersection #90: Foothill Expressway/Edith Avenue (PM peak hour)

* = Impact would not occur under Cumulative (2035) With Project conditions.
** = Impact occurs in the AM peak hour under Cumulative (2035) With Project conditions.

The Full Offset Housing Alternative would make a cumulatively considerable contribution to significant impacts at two more intersections than the proposed 2018 General Use Permit: Intersections #34 (Bowdoin Street/Stanford Avenue) and #69 (Middlefield Road/Charleston Road). In addition, the Full Offset Housing Alternative would make a cumulatively considerable contribution to both AM and PM peak hour significant impacts at Intersection #58 (Alma Street/ Charleston Road), while the proposed 2018 General Use Permit would make a cumulatively considerable contribution only in the PM peak hour. At Intersection #89 (Central Expressway. Castro Street-Moffett Boulevard) the Full Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the PM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in the AM peak hour. At Intersection #33 (Foothill Expressway/ Springer Road- Magdalena Avenue), the Full Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the AM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in both peak hours.

Generally, at the study intersections located closest to the campus, the Full Offset Housing Alternative would increase congestion compared to the proposed Project. At the study intersections located farther from the campus, the Full Offset Housing Alternative would reduce congestion by a small degree compared to the proposed Project because peak hour, peak direction residence-based trips are assumed to start and end at destinations closer to the Stanford campus as compared to peak hour, peak direction commute trips. When compared to the proposed Project, the Full Offset Alternative would add approximately 200 to 220 peak hour trips to intersections directly adjacent to the campus along El Camino Real and between 30 to 130 peak hour trips to intersections that border the campus along Sand Hill Road and Junipero Serra Boulevard.

Overall, the Full Offset Housing Alternative would not reduce significant effects of the proposed 2018 General Use Permit under Cumulative (2035) conditions.

In the Cumulative (2035) With Half Offset Housing Alternative analysis, significant impacts are identified at 21 intersections:

- Intersection #2: I-280 NB Off-Ramp/Sand Hill Road (AM peak hour)
- Intersection #17: Junipero Serra Blvd./Foothill Expressway/Page Mill Road (AM and PM peak hours)
- Intersection #19: Hanover Street/Page Mill Road (AM peak hour)
- Intersection #20: El Camino Real/Page Mill Road/Oregon Expressway (AM and PM peak hours)
- Intersection #21: Middlefield Road/Oregon Expressway (AM peak hour)
- Intersection #29: Foothill Expressway/Hillview Avenue (AM peak hour)
- Intersection #30: Foothill Expressway/Arastradero Road (AM and PM peak hours)
- Intersection #31: Foothill Expressway/San Antonio Road (PM peak hour)
- Intersection #32: Foothill Expressway/El Monte Avenue (AM peak hour)
- Intersection #33: Foothill Expressway/Springer Road-Magdalena Avenue (AM peak hour)
- Intersection #37: El Camino Real/Encinal Avenue (PM peak hour)
- Intersection #38: El Camino Real/Valparaiso Avenue (PM peak hour)
- Intersection #41: El Camino Real/Ravenswood Road (PM peak hour)
- Intersection #48: El Camino Real/Embarcadero Road (PM peak hour)
- Intersection #56: Alma Street/Hamilton Avenue (PM peak hour)
- Intersection #58: Alma Street/Charleston Road (AM* and PM peak hours)
- Intersection #59: Middlefield Road/Marsh Road (AM peak hour)
- Intersection #63: Middlefield Road/Lytton Avenue (PM peak hour)
- Intersection #66: Middlefield Road/Embarcadero Road (AM and PM peak hours)
- Intersection #89: Central Expressway/Castro Street-Moffett Boulevard (PM peak hour)**
- Intersection #90: Foothill Expressway/Edith Avenue (PM peak hour)

* = Impact would not occur under Cumulative (2035) With Project conditions.
** = Impact occurs in the AM peak hour under Cumulative (2035) With Project conditions.

The Half Offset Housing Alternative would make a cumulatively considerable contribution to both AM and PM peak hour significant impacts at Intersection #58 (Alma Street/ Charleston Road), while the proposed 2018 General Use Permit would make a cumulatively considerable contribution only in the PM peak hour. At Intersection #89 (Central Expressway. Castro Street-Moffett Boulevard) the Half Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the PM peak

hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in the AM peak hour. At Intersection #33 (Foothill Expressway/ Springer Road- Magdalena Avenue), the Half Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the AM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in both peak hours.

Generally, at the study intersections located closest to the campus, the Half Offset Housing Alternative would increase congestion compared to the proposed Project. At the study intersections located farther from the campus, the Half Offset Housing Alternative would reduce congestion by a small degree compared to the proposed Project because peak hour, peak direction residence-based trips are assumed to start and end at destinations closer to the Stanford campus as compared to peak hour, peak direction commute trips. When compared to the proposed Project, the Half Offset Alternative would add approximately 110 peak hour trips to intersections directly adjacent to the campus along El Camino Real and between 10 to 60 peak hour trips to intersections that border the campus along Sand Hill Road and Junipero Serra Boulevard. Overall, the Half Offset Housing Alternative would not reduce significant effects of the proposed 2018 General Use Permit under Cumulative (2035) conditions. Mitigation measures to address these impacts are presented in Chapter 5.

Notes: **Bold text** indicates intersection operates at unacceptable level of service **Bold and highlighted text** indicates a significant impact.

*Indicates unsignalized intersection.

**Indicates intersection is ungsinalized under Existing and Background (2018) Conditions and signalized under Cumulative (2035) Conditions.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
   (SC CMP) – CMP intersection in Santa Clara County
   (SM CMP) – CMP intersection in San Mateo County
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Cumulative (2035) No Project and Cumulative (2035) With Proposed 2018 General Use Permit presents the results from the Page Mill Road Sensitivity Memorandum, which evaluated the effects of the TIA Part 2 project description on the surrounding transportation network assuming that Page Mill Road remained two lanes in each direction. These results are provided for comparison purposes only.
5. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
6. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
7. Change in critical volume to capacity ratio between Cumulative (2035) and Cumulative (2035) With Project and Cumulative (2035) With Housing Alternatives Conditions. This ratio is not applicable for side-street stop controlled intersections and is denoted by "N/A".
8. Change in average critical movement delay between Cumulative (2035) and Cumulative (2035) With Project and Cumulative (2035) With Housing Alternatives Conditions. This ratio is not applicable for side-street stop controlled intersections and is denoted by "N/A".
9. The US 101 / Willow Road interchange reconfiguration is estimated to be constructed by 2020, and is denoted by "N/A" under Existing Conditions.
10. A signal warrant is not met for this intersection.

4.2 CUMULATIVE (2035) FREEWAY SEGMENT ANALYSIS

The future operations of freeway mainline segments in Santa Clara County and San Mateo County are evaluated using V/C ratios, with the volume-to-capacity ratio greater than 1.0 indicating the vehicle demand exceeds capacity. Freeway volumes for the Cumulative (2035) No Project and Cumulative (2035) With Housing Alternatives cases were developed as described in Chapter 5 of TIA Part 2 and Chapter 2 of this Housing Alternatives TIA. As described in Chapter 3 of TIA Part 2, a Santa Clara County VTA freeway segment impact under Cumulative (2035) with Housing Alternatives Conditions is determined to occur when:

- the addition of traffic causes a freeway segment volume-to-capacity ratio to exceed 1.0, or
- the Housing Alternative increases traffic demand on a freeway segment already operating at a V/C greater than or equal to 1.0 by an amount equal to one percent or more of the segment capacity.

Freeway segments in San Mateo County also abide by these impact criteria. Plus, an impact may occur if the Housing Alternatives causes the freeway segment V/C ratio to increase by one (1.0) percent on a segment already operating at a V/C greater than or equal to 1.0.

Under Cumulative (2035) With Full Offset Housing Alternative Conditions, 16 freeway segments would meet the significance criteria, which is three more than under Cumulative (2035) with Project Conditions.

- Northbound State Route 85
    - Saratoga Avenue to De Anza Boulevard (PM peak hour)*;
    - South De Anza Boulevard to Stevens Creek Boulevard (AM and PM* peak hours);
    - Stevens Creek Boulevard to I-280 (AM peak hour);
- Southbound State Route 85
    - Stevens Creek Boulevard to South De Anza Boulevard (AM* and PM peak hours);
    - De Anza Boulevard to Saratoga Avenue (PM peak hour)*;
- Northbound Interstate 280
    - Lawrence Expressway to Wolfe Road (PM peak hour)*;
    - Wolfe Road to De Anza Boulevard (AM peak hour);
    - State Route 85 to Foothill Expressway (AM and PM peak hours);
    - Foothill Expressway to Magdalena Avenue (AM peak hour);
    - Sand Hill Road to Woodside Road (PM peak hour);
- Southbound Interstate 280**
    - Woodside Road to Sand Hill Road (AM peak hour);
    - Magdalena Avenue to Foothill Expressway (PM peak hour);
    - Foothill Expressway to State Route 85 (AM* and PM peak hours);
    - State Route 85 to De Anza Boulevard (PM peak hour);
    - De Anza Boulevard to Wolfe Road (PM peak hour);

- Wolfe Road to Lawrence Expressway (PM peak hour)*.

* = Impact would not occur under Cumulative (2035) with Project Conditions.
** = Southbound I-280 AM impact between Sheep Camp Trail to Edgewood Road would not occur under either Housing Alternative.

As explained in Section 4.1 of this Housing Alternatives TIA, the results for the Cumulative (2035) No Project and Cumulative (2035) with Proposed 2018 General Use Permit Conditions have been updated since publication of TIA Part 2 and the Draft Environmental Impact Report to correct the assumed lane configuration on Page Mill Road under Cumulative (2035) Conditions. Modeling conducted for TIA Part 2 used a six-lane configuration that VTA included in its 2040 traffic model. Subsequently, VTA staff indicated that inclusion of the six-lane configuration had been an error on the part of VTA. The updated results are based on modeling that assumes the existing four-lane configuration for Page Mill Road. The updated modeling followed the same process outlined in TIA Part 2, Chapter 5, and is described in the Fehr & Peers memorandum *Stanford 2018 General Use Permit: Cumulative (2035) Conditions with Four-Lane Page Mill Road from I-280 to Junipero Serra Boulevard* (March 22, 2018).

The revised assumption that Page Mill Road remains four lanes between I-280 and Junipero Serra Boulevard/Foothill Road in 2035,results in two additional freeway segments meeting the impact criteria under the proposed Project (the 2018 General Use Permit) compared to the number of freeway segments identified as meeting the criteria in TIA Part 2 and the Draft EIR[5]:

- I-280 Southbound, Woodside Road to Sand Hill Road, AM peak hour
- I-280 Southbound, SR 85 to De Anza Boulevard, PM peak hour

Compared to the proposed 2018 General Use Permit Conditions, the Full Offset Housing Alternative would add four new freeway segments that meet the significance criteria. However, one freeway segment that meets the criteria under the proposed 2018 General Use Permit would not meet the criteria under the Full Offset Housing Alternative (Southbound Interstate 280 from Sheep Camp Trail to Edgewood Road) due to the reduction in commuter trips traveling toward campus in the morning. In addition, the Full Offset Housing Alternative would extend impacts at three freeway segments to both the AM and PM peak hours, while the proposed 2018 General Use Permit would not result in a significant impact to those freeway segments in one of the two peak hours. Overall, the Full Offset Housing Alternative would not reduce the significant impacts of the proposed 2018 General Use Permit.

Under Cumulative (2035) With Half Offset Alternative Conditions, 13 segments would meet the significance criteria, which is the same as the number that would meet the criteria under Cumulative (2035) With Project Conditions.

[5] The Draft EIR concludes that impacts to freeway segments would be significant and unavoidable under Cumulative (2035) with Project conditions. The addition of two more freeway segments to the list presented in the Draft EIR does not change the Draft EIR's conclusion.

- Northbound State Route 85
    - South De Anza Boulevard to Stevens Creek Boulevard (AM peak hour);
    - Stevens Creek Boulevard to I-280 (AM Peak hour);
- Southbound State Route 85
    - Stevens Creek Boulevard to South De Anza Boulevard (PM peak hour);
    - De Anza Boulevard to Saratoga Avenue (PM peak hour)*;
- Northbound Interstate 280
    - Wolfe Road to De Anza Boulevard (AM peak hour);
    - State Route 85 to Foothill Expressway (AM and PM peak hours);
    - Foothill Expressway to Magdalena Avenue (AM peak hour);
    - Sand Hill Road to Woodside Road (PM peak hour);
- Southbound Interstate 280**
    - Woodside Road to Sand Hill Road (AM peak hour);
    - Magdalena Avenue to Foothill Expressway (PM peak hour);
    - Foothill Expressway to State Route 85 (AM* and PM peak hours);
    - State Route 85 to De Anza Boulevard (PM peak hour);
    - De Anza Boulevard to Wolfe Road (PM peak hour).

* = Impact would not occur under Cumulative (2035) With Project conditions
** = Southbound I-280 AM impact between Sheep Camp Trail to Edgewood Road would not occur under either Housing Alternative.

Compared to the proposed 2018 General Use Permit Conditions, the Half Offset Housing Alternative would add one new freeway segment that would meet the significance criteria. However, one freeway segment that would meet the significance criteria under the proposed 2018 General Use Permit would not meet the significance criteria under the Half Offset Housing Alternative (Southbound Interstate 280 from Sheep Camp Trail to Edgewood Road) due to the reduction in commuter trips traveling toward campus in the morning. In addition, the Half Offset Housing Alternative would extend impacts at one freeway segment to both the AM and PM peak hours, while the proposed 2018 General Use Permit would result in a significant impact to that freeway segment in only the PM peak hour. One freeway segment with a significant impact under the proposed 2018 General Use Permit would not have a significant impact under the Half Offset Housing Alternative (Southbound Interstate 280 from Camp Trail to Edgewood Road). Overall, the Half Offset Housing Alternative would not reduce the significant impacts of the proposed 2018 General Use Permit.

Appendix E includes the freeway V/C ratio calculations, levels of service, and impact assessment. See Chapter 5: Transportation Impact Assessment, for further discussion on freeway segment impacts and mitigations.

4.3 CUMULATIVE (2035) TRANSIT DELAY ANALYSIS

The Housing Alternatives would add traffic along major transit corridors throughout the Cities of Palo Alto and Menlo Park, which could affect operations of VTA and SamTrans bus routes. The bus routes evaluated

along with the methodology for estimating this delay are described in Chapter 3, Section 6 (Transit Service Analysis Methods) in the TIA Part 2. The additional delay to transit service in the area due to implementation of the Housing Alternatives can be found in **Table 4-2**. **Appendix F** contains the calculation summary for each transit route.

The Housing Alternatives would not substantially increase transit delay relative to the total route travel times, for the transit routes assessed. As shown in **Table 4-2** for the Cumulative (2035) With Full Offset Housing Alternative conditions, the traffic would increase the travel times by less than 30 seconds on all but seven routes and increase travel times by less than 60 seconds on all but four routes. For the Cumulative (2035) With Half Offset Housing Alternative conditions, the traffic would increase the travel times by less than 30 seconds on all but six routes and increase travel times by less than 60 seconds on all of the routes. Dumbarton Express 1 would experience a longer delay change, at 108.3 seconds in the westbound direction during the AM peak hour only and 86.6 seconds in the eastbound direction during the PM peak hour only, with the Full Offset Alternative. For both peak hours, this delay constitutes less than three percent of the total travel time on that route.

Next to the Dumbarton Expressway 1 route, VTA Routes 104, 22, and 522 would experience delays greater than 60 seconds during the PM peak hour for the Cumulative (2035) With Full Offset Housing Alternative. VTA is studying the implementation of a Bus Rapid Transit (BRT) system on El Camino Real that would extend into the study area with a terminus at the Palo Alto Downtown Transit Center. The BRT system would be an update of the existing 522 service. Therefore, delays for the future BRT service would be similar to the delay for the existing 522 service. Of the seven alternatives presented in the El Camino Real Bus Rapid Transit Draft Environmental Impact Report/Environmental Assessment (October 2014), only one would provide a dedicated BRT lane in Palo Alto extending from City of Mountain View city limits to Embarcadero Road. All other alternatives would require buses to operate within mixed-flow lanes or HOV lanes without signal modifications. Therefore, under the majority of the alternatives being considered, the delays to the future BRT service would be similar to the delays experienced by the existing 522 service.

The above results can be compared to the Cumulative (2035) With Project analysis, in which the Project traffic would add delays of less than 30 seconds on all but three routes, and less than 40 seconds on all routes, as shown in **Table 4-2**.

TABLE 4-2: CUMULATIVE (2035) WITH HOUSING ALTERNATIVES TRANSIT ROUTE DELAY[1]

Note:

1. Transit delay is calculated by summing each transit route movements through the study intersections. Some movements may experience large increases or decreases in delay as a result of the analysis software (Traffix 8.0) redistributing green time for each phase.

2. The Project was not considered to have a measureable change in overall transit delay if the increase in travel time was less than five seconds or the travel time improved slightly (due to changes in signal timing, critical movement changes, etc.).

3. Cumulative (2035) With Proposed 2018 General Use Permit presents the results from the Page Mill Road Sensitivity Memorandum, which evaluated the effects of the TIA Part 2 project description on the surrounding transportation network assuming that Page Mill Road remained two lanes in each direction. These results are provided for comparison purposes only.

Source: Fehr & Peers, April 2018.

4.4 CUMULATIVE (2035) BICYCLE AND PEDESTRIAN QUALITY OF SERVICE ANALYSIS

Pedestrian and bicycle QOS analysis is presented in Chapter 5, as the analysis depends on the traffic mitigation measures proposed.

5. TRANSPORTATION IMPACT ASSESSMENT

This chapter discusses the Housing Alternatives' impacts to the study intersections, freeway segments, neighborhood streets, transit, bicycle and pedestrian facilities, and safety and emergency access.

5.1 INTERSECTION IMPACTS AND MITIGATION MEASURES

For the proposed 2018 General Use Permit, Stanford intends to prevent significant impacts to intersection and freeway congestion by achieving the Stanford Community Plan's No Net New Commute Trips goal through the use of trip reduction efforts (both for Stanford and non-Stanford trips), infrastructure improvements that will serve and promote the use of non-auto modes, and funding contributions to programs that will reduce auto trips. It is Stanford's intent to avoid the need for intersection capacity improvements.

Stanford is not confident that the No Net New Commute Trips goal can be achieved under the Housing Alternatives. Prior to submitting its application for the 2018 General Use Permit, Stanford worked closely with transportation consultants at Arup and Fehr & Peers to evaluate whether it would be feasible to continue to achieve the No Net New Commute Trips standard. Arup developed a mode share model for Stanford's populations to better understand current Stanford commuters' preferences for selecting their transit modes, and to enable Stanford to plan its Transportation Demand Management (TDM) programs to meet the needs of a dynamic population in the future. The mode share model utilizes the extensive information that Stanford collects each year through its annual commute survey, including mode choice, age, gender, geography, and campus arrival/departure times. The mode share model is used to predict the

mode split outcomes of potential future TDM measures, both on their own and acting together as packages of improvements, with the assumption that Stanford commuters select a mode that provides the best combination of travel time, convenience and cost. This allows for predictions of specific numbers of commute trips that could be expected under various improvement scenarios, and a comparison with current TDM options and additional reductions needed to achieve the No Net New Commute Trips standard.

Stanford carefully vetted the modeling results internally to understand the feasibility and financial implications of expanding its TDM programs to achieve the No Net New Commute Trips standard under the 2018 General Use Permit. This process gave Stanford confidence that, barring unforeseen externalities, it would be able to achieve the standard.

Stanford has not tested whether it would be possible to achieve the No Net New Commute Trips standard under the Housing Alternatives. The Housing Alternatives trip generation analysis presented in Section 2 of this Housing Alternatives TIA concludes that the Alternatives would increase peak hour, peak direction trips. Specifically:

- Compared to the proposed 2018 General Use Permit, the Full Offset Housing Alternative would replace 244 morning peak hour inbound trips by commuters with 357 morning peak hour inbound trips by campus residents.
- Compared to the proposed 2018 General Use Permit, the Full Offset Housing Alternative would replace 213 evening peak hour outbound trips by commuters with 459 evening peak hour outbound trips by campus residents.
- Compared to the proposed 2018 General Use Permit, the Half Offset Housing Alternative would replace 122 morning peak hour inbound trips by commuters with 179 morning peak hour inbound trips by campus residents.
- Compared to the proposed 2018 General Use Permit, the Half Offset Housing Alternative would replace 107 evening peak hour outbound trips by commuters with 229 evening peak hour outbound trips by campus residents.

Stanford's mode share model does not focus on trips by residents. The model focuses on mode choices by Stanford affiliates who live off-campus, and commute to and from campus. This is because Stanford's TDM programs primarily are designed to enable off-campus residents to use modes other than single occupant vehicles to commute to work and classes. Stanford has not modeled or designed programs to reduce an increase in trips by campus residents at the magnitude that would occur under the Housing Alternatives.

Programs focused on commuters may not be effective in offsetting residence-based trips. For example, to encourage employees and students living off campus to use Caltrain, Stanford provides Go Passes. By providing the free Go Passes, and charging for on-campus parking, Stanford has motivated commuters to use transit to get to campus, which is evident in the 20 percent mode share for Caltrain. By contrast, spouses

and other non-Stanford affiliates living in campus housing may work at locations that do not provide Go Passes and/or that do not charge for parking.

Equally important, Stanford makes it seamless for commuters to use Caltrain and AC Transit buses by providing Marguerite shuttle service timed to meet the trains and buses as they arrive at the campus, with routes designed to move transit riders quickly and efficiently to and from campus buildings. Non-Stanford affiliates living in campus housing could easily reach Caltrain and bus lines, but may not have feasible ways to bridge the gaps between train and bus stations at their workplace end of the trip (i.e., the last mile service).

In addition, all campus residents, including Stanford affiliates, would travel between their residences and local and regional destinations for shopping, entertainment, and recreation. The trip generation analysis indicates that many of these types of trips could occur in the peak hour in the peak direction. Stanford's TDM programs can address some of these types of trips, but many of these types of trips cannot effectively be addressed through TDM measures.

A study on commuter behaviors conducted by the University of Denver found that commuters who work near transit have much stronger transit commute habits than those who live near transit. These findings are consistent with Stanford's concerns that TDM programs may not be as effective in getting a very large increase in residents out of their cars compared to commuters.[6]

Stanford also has expressed concerns that the large magnitude of increased peak hour trips (in both directions) and in all-day trips could have unforeseen consequences. The Housing Alternatives trip generation analysis presented in Section 2 of this Housing Alternatives TIA concludes that the Alternatives would increase total peak hour trips by a very large amount.

- Compared to the proposed 2018 General Use Permit, the Full Offset Housing Alternative would increase total PM peak hour trips by 740 trips. The Alternative would replace 344 peak hour commute trips with 1,084 peak hour residence-based trips.
- Compared to the proposed 2018 General Use Permit, the Half Offset Housing Alternative would increase total PM peak hour trips by 370 trips. The Alternative would replace 172 peak hour commute trips with 542 peak hour residence-based trips.

The 2018 General Use Permit: Housing Alternatives SB 743 Vehicle Miles Traveled Analysis concludes that the Full Offset Housing Alternative would increase total VMT by over 34 million miles per year compared to the proposed 2018 General Use Permit. That analysis accounts for trips throughout the day.

[6] The impact of transit station areas on the travel behaviors of workers in Denver, Colorado. October 2015. https://www.sciencedirect.com/science/article/pii/S0965856415002244.

Stanford provides many of its TDM programs regardless of travel direction and time of day. It may prove infeasible to scale the program to accommodate the magnitude of increased vehicle trips that would occur under the Housing Alternatives.

Like the TIA Part 2, this Traffic Impact Assessment conservatively assumes that Stanford does not achieve the No Net New Commute Trips goal, and does not expand its existing TDM programs. Under this assumption, intersection impacts were evaluated under Background (2018) with Housing Alternatives and Cumulative (2035) with Housing Alternatives Conditions. For each scenario (2018 and 2035), the evaluation is organized as follows:

- Intersections with significant impacts are listed, and impact statements for each intersection, along with proposed mitigation measures, are presented, grouped by jurisdiction.
- Where possible, feasible physical and/or operational mitigation measures have been identified and are presented. The acronym "LTS" is used if the mitigation measure reduces the impact to a less-than-significant level. Impacts that would remain significant and unavoidable after mitigation are designated "SU".
- For intersection impacts, the effect of the proposed mitigation measure on bicycle and pedestrian quality of service (QOS) is also described using StreetScore+.

5.1.1 TRAFFIC MITIGATION APPROACH

Sections 5.1.2 and 5.1.3 describe physical and operational improvements to address the 2018 General Use Permit's significant impacts on intersections in the traffic study area. These impacts are projected to occur if Stanford generates peak hour vehicle trips at the same rates as those of the current campus. However, Stanford intends to limit the trip growth under the 2018 General Use Permit as it has successfully done under the 2000 General Use Permit. Since 2001, Stanford has met its No Net New Commute Trips target every year, even as the campus facilities and populations grew. This is documented in the annual traffic monitoring reports prepared to implement the 2000 General Use Permit Conditions of Approval. The monitoring process considers both trips entering the campus cordon in the morning peak hour and exiting in the afternoon peak hour (as adjusted per the approved monitoring methodology), along with Stanford-provided trip reductions outside of campus. In the 2018 General Use Permit Application, Section 7.1, Stanford proposes a continuation of the No Net New Commute Trips goal. Stanford intends to enhance the mechanisms by which the University would contribute to vehicle trip reductions within the traffic impact area. The proposed program is summarized below.

As explained at the beginning of this Section 5.1, Stanford is not confident that the No Net New Commute Trips goal can be achieved under the Housing Alternatives. As a result, this Housing Alternatives TIA assumes that the additional housing contemplated by the Housing Alternatives would be located outside the cordons used to measure compliance with the No Net New Commute Trips standard, or the trips associated with the additional housing would be removed from campus cordon counts.

5.1.1.1 No Net New Commute Trips Goal

Stanford has stated in its application that it intends to continue to take all necessary steps to meet the No Net New Commute Trips goal established in the Stanford Community Plan. The goal is defined to mean no additional trips above a base level during the peak commute hour in the campus commute direction. Based on an extensive modeling analysis, Stanford is confident that, barring unforeseen circumstances, it will be able to achieve the No Net New Commute Trips standard under the 2018 General Use Permit.

Stanford is not confident that the No Net New Commute Trips can be achieved with the Housing Alternatives for the reasons provided at the beginning of this Section 5.1.

5.1.1.2 Travel Demand Management Program

Stanford plans to continue to mitigate the transportation impacts of its proposed 2018 General Use Permit development by implementing a TDM program designed to achieve the No Net New Commute Trips goal. Stanford's TDM program has contributed to a decrease in Stanford's commuter drive-alone rate from 72 percent in 2002 to 50 percent today. Under the proposed Project, Stanford will continue to monitor program effectiveness and adjust the specific services, incentives and disincentives over time to optimize the effectiveness of the programs.

Stanford is not confident that the No Net New Commute Trips can be achieved with the Housing Alternatives for the reasons provided at the beginning of this Section 5.1. This Housing Alternatives TIA assumes that the additional housing contemplated by the Housing Alternatives would be located outside the cordons used to measure compliance with the No Net New Commute Trips standard, or the trips associated with the additional housing would be removed from campus cordon counts.

5.1.1.3 Off-Campus Trip Reductions: Stanford-Provided Programs and Services, and Funding for Infrastructure Projects

Stanford proposes in its application to continue to recognize off-campus trip reductions efforts as specified by Stanford Community Plan policy C-8 and 2000 General Use Permit Condition G.8 with two minor modifications. First, Stanford proposes a clarification to the existing policy that reduction of an off-campus trips can be recognized as long as one terminus for the trip is within the local impact boundary. For example, if Stanford runs a shuttle to East Palo Alto and an East Palo Alto resident rides that shuttle to a business in Palo Alto, a vehicle trip will have been removed within the targeted geographic boundary.

Second, Stanford proposes that funding off-campus circulation infrastructure improvements may qualify for trip credits as long as the improvements would enhance safety or increase mobility for pedestrians, bicyclists or transit users within the local impact area. For example,

- funding roadway modifications to add transit vehicle lanes or bicycle lanes;

- adding signals to improve pedestrian or bicycle safety;
- providing transit signal pre-emption along major corridors;
- connecting gaps in the bicycle network;
- reducing non-local traffic in neighborhood areas through traffic calming measures; and
- other pedestrian, bicycle and transit-supportive projects envisioned in the Palo Alto Comprehensive Plan and ConnectMenlo, could qualify for trip credits under this approach if approved by the County.

Any proposal for such credits would be accompanied by evidence demonstrating how the project or program would remove vehicular trips from the local impact area.

5.1.1.4 Funding for Others' Off-Campus Trip Reduction Programs and Intersection Improvements

For the 2018 General Use Permit, Stanford proposes in its application that its first priority would be to take steps within its own control to reduce trips through trip reduction measures and trip credits, as described above. However, if Stanford cannot achieve the No Net New Commute Trips goal using those two means, Stanford would pay a per-trip fee that would be used by Santa Clara County to (a) fund other entities' trip reduction programs; or (b) apply such funds to intersection improvements identified in the TIA.

Payment would be made to an account managed by the County Planning Office that could be used to fund off-campus projects that encourage and improve use of alternative transportation modes or otherwise reduce peak period traffic. These projects could include transit improvements that directly or indirectly benefit the local impact area and community education and outreach regarding non-auto mode transportation options. This fund also could be used for transportation improvements that increase safety and mobility for pedestrians, bicyclists and transit users.

This Housing Alternatives TIA assumes that the incremental trips associated with the Housing Alternatives would be mitigated through fair share contributions to intersection improvements.

5.1.1.5 Funding Calculation

In its application, Stanford proposes that the amount of the payment for each exceeded trip be based upon the dollar amount that otherwise would be expended for intersection improvements required to mitigate the effects of development under the 2018 General Use Permit. Such a payment program is consistent with Stanford Community Plan implementation measure SCP-C (i)(9).

To calculate the annual payment on a per-trip basis, the total amount of Stanford's fair-share contribution to all intersection improvements would be divided by 17, to reflect the number of years that the 2018 General Use Permit is expected to be in effect. The resulting quotient would then be divided by the number

of peak hour, peak direction vehicle trips anticipated to occur absent the No Net New Commute Trips goal. That per-trip dollar amount times the number of trips exceeding the goal would constitute the payment necessary. In no event would Stanford be required to pay cumulatively over the time period of the 2018 General Use Permit more than the total amount of its fair-share contribution toward feasible improvements at impacted intersections and roadways.

As noted above, this Housing Alternatives TIA assumes that the additional housing contemplated by the Housing Alternatives would be located outside the cordons used to measure compliance with the No Net New Commute Trips standard, or the trips associated with the additional housing would be removed from campus cordon counts. This Housing Alternatives TIA assumes that the incremental trips associated with the Housing Alternatives would be mitigated through fair share contributions to intersection improvements.

5.1.2 BACKGROUND (2018) WITH HOUSING ALTERNATIVES CONDITIONS

Table 3-1 shows the delays, LOS results, and changes in critical volume-to-capacity ratio and delay used to identify significant intersection impacts under Background (2018) with Housing Alternatives Conditions. Based on the impact criteria listed in Chapter 3 of TIA Part 2, both Housing Alternatives would have significant impacts at the following five intersections:

- Intersection #2: I-280 NB Off-Ramp/Sand Hill Road (AM peak hour)
- Intersection #13: I-280 SB Off-Ramp/Page Mill Road (AM and PM peak hours)
- Intersection #17: Junipero Serra Blvd./Foothill Expwy./Page Mill Road (AM and PM peak hours)
- Intersection #30: Foothill Expressway/Arastradero Road (PM peak hour)
- Intersection #58: Alma Street/Charleston Road (PM peak hour)

These same five intersections would experience significant impacts under the proposed 2018 General Use Permit. The TIA Part 2 identified one additional intersection with a significant impact under the proposed 2018 General Use Permit at Intersection #31, Foothill Expressway/ San Antonio Road. However, that result was due to a volume error that has since been corrected. Therefore, the Housing Alternatives would result in significant impacts at the same intersections as the proposed 2018 General Use Permit.

Generally, at the study intersections located closest to the campus, the Housing Alternatives would increase congestion compared to the proposed Project. At the study intersections located farther from the campus, the Housing Alternatives would reduce congestion by a small degree compared to the proposed Project because peak hour, peak direction residence-based trips are assumed to start and end at destinations closer to the Stanford campus as compared to peak hour, peak direction commute trips. When compared to the proposed Project, the Full Offset Alternative would add approximately 200 to 220 peak hour trips to intersections directly adjacent to the campus along El Camino Real and between 30 to 130 peak hour trips to intersections that border the campus along Sand Hill Road and Junipero Serra Boulevard. The Half Offset Alternative would add approximately 110 peak hour trips to the same El Camino Real intersections and

between 10 to 60 peak hour trips to other bordering intersections. Overall, the Housing Alternatives would not reduce significant effects of the proposed 2018 General Use Permit under 2018 conditions.

Where feasible physical capacity improvements or other operational improvements are possible, they have been identified, and are described below, along with the post-mitigation level of service and resulting impact level of significance. A bicycle and pedestrian QOS evaluation was performed for each mitigation location, to assess the impacts on bicycle and pedestrian conditions of the proposed mitigation, using the methodology described in Chapter 3 of TIA Part 2. These impacts are also described below. **Table 5-1** and **Table 5-2** summarize all of this information, for the five impacted locations, for the Full Offset and Half Offset Housing Alternatives, respectively. **Appendix G** contains the mitigation LOS calculations. **Appendix H** shows the bicycle and pedestrian StreetScore+ QOS results for each location.

5.1.2.1 Santa Clara County

I-280 Southbound Off-Ramp/Page Mill Road (Intersection #13) – The addition of Housing Alternatives traffic under Background (2018) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for an unsignalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an unacceptable LOS F during the AM and PM peak hours. It would continue to function at LOS F under Background (2018) No Project Conditions and Background (2018) With Housing Alternatives conditions while also meeting the criteria for a peak hour signal warrant. This intersection serves two major corridors, I-280 and Page Mill Road, which traverse the City of Palo Alto and connects to El Camino Real and US 101. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested intersection in 2018.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the installation of a traffic signal.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
Installation of a traffic signal would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	Installation of a traffic signal would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings	Quality of Service Findings
The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle StreetScore+ QOS would remain at QOS 3.7.	The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle StreetScore+ QOS would remain at QOS 3.7.

Because this improvement requires additional funding that has not yet been identified, and depends on actions taken by Caltrans, Santa Clara County may find that this improvement would not be implemented

in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

Aside from large eastbound/westbound shoulders for bicyclists, there are no other bicycle or pedestrian facilities at this intersection. Depending on the ultimate design, additional bicycle facilities may be implemented at this intersection. However, as the intersection is currently striped, the mitigation measure would not adversely affect the existing bicycle facilities.

There is no pedestrian access at this intersection; therefore the proposed mitigation measure would have no effect on pedestrian quality of service as pedestrians are not allowed at the intersection.

It is noted that Santa Clara County's *Page Mill Expressway Corridor Study Report* describes improvements along the length of Page Mill Road from the I-280 Southbound Ramps to El Camino Real. The improvement concept at the I-280 Southbound Ramps intersection is a roundabout with a traffic signal at the I-280 Northbound Ramps intersection and a third eastbound and westbound through lane on Page Mill Road to the east of the I-280 Northbound Ramps intersection. The County will determine the ultimate improvement design and phasing for the corridor improvements. The Housing Alternative's fair-share funding contribution identified above may be applied toward a roundabout at the I-280 Southbound Ramps intersection if the County chooses, and the timing of this improvement will also be determined by the County.

Junipero Serra Boulevard-Foothill Expressway/Page Mill Road (Intersection #17) – The addition of traffic under Background (2018) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an unacceptable LOS F during the AM and PM peak hours. It would continue to function at LOS F under Background (2018) No Project Conditions and Background (2018) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors that connect to I-280 and also provides a parallel route to I-280. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested intersection in 2018.

The following physical improvements are capable of reducing this impact:

- For the proposed 2018 General Use Permit, the impact at this intersection would be reduced to a less-than-significant level under Cumulative (2035) Conditions with the following mitigation: Contribute fair share funding toward
    - (1) addition of a third through lane on Page Mill Road in the westbound direction (for a total of two left-turn lanes, three through lanes and a right turn lane (plus a bike lane));
    - (2) addition of a receiving lane to westbound Page Mill Road (resulting in three lanes from Junipero Serra Boulevard approximately to Old Page Mill Road); and
    - (3) installation of an overlap phase for northbound and southbound right-turning vehicles and widening of the southbound approach to two lanes between Page Mill Road and Stanford Avenue to align with the existing designated right-turn lane.[7]
- For the Full Offset Housing Alternative, the impact at this intersection cannot be mitigated to a less-than-significant level with the mitigation proposed for the Project. Instead, the following mitigation would be needed: If such grade separation is approved and implemented, contribute fair share funding toward the grade separation project at this intersection identified in the *County Expressway Plan 2040*.
- For the Half Offset Housing Alternative, the impact at this intersection cannot be mitigated to a less-than-significant level with the mitigation proposed for the Project. Instead, the following additional mitigation would be needed to mitigate the impact to a less than significant level under Cumulative (2035) Conditions: Contribute fair share funding toward installation of an overlap phase for the westbound right-turn lane.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
Installation of the grade separation project at this intersection would require significant acquisition of right-of-way. Modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings With the exception of construction-related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. Pedestrian QOS would improve from QOS 4 to QOS 2.5.	The new westbound improvements would require some right of way (10-12 feet) from the subdivision corner (northeast) and along the dish parcel for the receiving lane (northwest). Installation of an overlap phase for northbound, southbound, and westbound right-turning vehicles would be accommodated through the modification of the existing traffic signal, which requires no additional right-of-way. Widening the southbound approach to two lanes between Page Mill Road and Stanford Avenue will likely require the acquisition of additional right-of-way. This improvement would allow southbound right-turning vehicles additional queuing space so southbound through vehicles do not block the right-turn lane. With this mitigation, the impact would be reduced to a *less-than-significant* level under Cumulative (2035) Conditions, but would remain ***significant and unavoidable*** under Background (2018) conditions. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.5 and QOS 4, respectively.

Because these improvements have not undergone CEQA review, and would require additional funding that has not yet been identified, Santa Clara County may find that these improvements would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable.** In addition, the impact under the proposed 2018 General Use Permit and under the Half Offset Alternative would remain **significant and unavoidable** under Background (2018) Conditions because the mitigation, if implemented would not reduce congestion to a less-than-significant level in 2018. The mitigation measures identified for the proposed 2018 General Use Permit and Half Offset Alternative would, however, reduce the impact to a less-than-significant level if implemented by 2035.

Grade separation of Page Mill Road at Junipero Serra Boulevard was identified as a Tier 3 improvement in the *County Expressway Plan 2040*. The grade separation improvements were identified as mitigation for the Full Offset Housing Alternative in order to bring the intersection impact to a less-than-significant level. Right-turn lanes and high vehicle speeds would continue to cause uncomfortable situations for bicyclists at the intersection. However, the mitigation would cause pedestrian QOS to improve from QOS 4 to QOS 2.5. With the proposed mitigation, the pedestrian crossing distances at the northbound and southbound approaches would be reduced from the existing 6+ lanes to an estimated 2 to 3 lanes, providing more comfortable pedestrian crossing conditions at the intersection.

With the proposed Half Offset Housing Alternative mitigation, a second lane would be added traveling southbound between Stanford Avenue and Page Mill Road, aligning with the existing designated southbound right-turn lane at Page Mill Road, and would not impact the existing intersection configuration of the southbound approach. A third through lane would be added to the westbound approach and continued on the westbound receiving lanes, requiring additional right-of-way, and increasing the pedestrian crossing distance on the east and west legs of the intersection. In addition, the north/south bicycle crossing distances would increase slightly due to the additional through lane while maintaining but not exacerbating the current uncomfortable conditions for bicyclists and pedestrians at the intersection

It is noted that there is a Tier 1 improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040* to widen Page Mill Road from just east of Junipero Serra Boulevard-Foothill Expressway to the I-280 ramps. The Tier 1 improvement is fully funded through Measure B but conservatively is not anticipated to be in place by 2035. This was evaluated as a potential mitigation measure and was determined not bring the impact to a less-than-significant level under 2018 Conditions.

Foothill Expressway/Arastradero Road (Intersection #30) – The addition of traffic under Background (2018) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the PM peak hour. Under Existing Conditions,

[7] The third improvement was identified as a mitigation measure in the Draft EIR. Two additional improvements have been added to ensure the impact is mitigated to a less-than-significant level under the assumption that Page Mill Road is four lanes, rather than six lanes as previously depicted in the VTA 2040 model.

this intersection functions at an unacceptable LOS F during the PM peak hour. It would continue to function at LOS F under Background (2018) No Project Conditions and Background (2018) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would decrease the average critical delay and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2018.

The following physical improvements are capable of reducing this impact:

- If such grade separation is approved and implemented, contribute fair-share funding toward a grade separation project as identified in the draft *Santa Clara County* Expressway Plan *2040*. The grade separation assumed for purposes of analysis includes a separated through-way for vehicles on Foothill Expressway.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
Although the configuration of this proposed interchange has yet to be determined, additional right-of-way would be required to construction this improvement. Due to the close proximity of the Miranda Avenue/Arastradero Road intersection, additional modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	Although the configuration of this proposed interchange has yet to be determined, additional right-of-way would be required to construction this improvement. Due to the close proximity of the Miranda Avenue/Arastradero Road intersection, additional modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings	Quality of Service Findings
With the exception of construction-related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. Pedestrian QOS would improve from QOS 4 to QOS 2.5.	With the exception of construction-related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. Pedestrian QOS would improve from QOS 4 to QOS 2.5.

Because this improvement has not undergone CEQA review, may not be approved, and would require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

Right-turn lanes and high vehicle speeds would continue to cause uncomfortable situations for bicyclists at the intersection. With the proposed mitigation, the pedestrian crossing distances at the northbound and southbound approaches would be reduced from the existing 6+ lanes to an estimated 2 to 3 lanes, providing more comfortable pedestrian crossing conditions at the intersection.

5.1.2.2 City of Palo Alto

Alma Street/Charleston Road (Intersection #58) – The addition of Housing Alternatives traffic under Background (2018) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D. It would continue to function at LOS D in the PM peak hour under Background (2018) No Project Conditions, but would function at unacceptable LOS E in the PM peak hour under Background (2018) With Housing Alternatives Conditions. This intersection serves two major corridors serving the Cities of Palo Alto and Mountain View, including connections to US 101, El Camino Real and I-280. As such, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2018.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a designated northbound right-turn lane and installation of an overlap phase for the northbound and southbound right-turn movements.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a designated northbound right-turn lane, the northbound approach would need to be widened and will likely require the acquisition of additional right-of-way. Installation of an overlap phase for northbound and southbound right-turning vehicles would be accommodated through the modification of the existing traffic signal. With this mitigation, the level of service would be improved and the impact would be reduced, but not to a less than significant level. Therefore, the impact would remain **significant and unavoidable**. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.3 and QOS 3.5, respectively.	To accommodate the construction of a designated northbound right-turn lane, the northbound approach would need to be widened and will likely require the acquisition of additional right-of-way. Installation of an overlap phase for northbound and southbound right-turning vehicles would be accommodated through the modification of the existing traffic signal. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.3 and QOS 3.5, respectively.

Because the proposed improvement depends on the actions of the City of Palo Alto, and may require additional funding that has not yet been identified, Santa Clara County may find that these improvements would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable.** In addition, the impact under the Full Offset Housing Alternative would remain **significant and unavoidable** under Background (2018)

Conditions because the mitigation, if implemented would not reduce congestion to a less-than-significant level in 2018.

With the proposed mitigation, pedestrian crossing distances would increase slightly on the south leg of the intersection and remain unchanged on all other approaches while maintaining the current quality of service score at the intersection. Bicycle lanes on the eastbound and westbound approaches, and low right-turn speeds would remain, resulting in slightly better conditions compared to what bicyclists experience on the northbound and southbound approaches. The proposed mitigation measure would not conflict with the City of Palo Alto's proposed Class III facility along Alma Street as identified in the City of Palo Alto *Bicycle & Pedestrian Transportation Plan*. With a Class III facility, bicyclists travel in the vehicle lane and do not require a separated space as with a bicycle lane.

5.1.2.3 City of Menlo Park

I-280 Northbound Off-Ramp/Sand Hill Road (Intersection #2) – The addition of Housing Alternatives traffic under Background (2018) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the AM peak hour. It would function at an unacceptable LOS F in the AM peak hour under Background (2018) No Project Conditions and under Background (2018) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average delay on the eastbound through (local) approach by more than 0.8 seconds. The unacceptable LOS conditions in the AM peak hour are the result of a substantial increase in traffic growth at the Sand Hill Road interchange, along with Housing Alternatives traffic primarily entering the northbound ramps intersection from the west (i.e. from the southbound off-ramp).

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a second northbound right-turn lane as identified in the *ConnectMenlo Final Environmental Impact Report*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a second northbound right-turn lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle StreetScore+ QOS would remain at QOS 4.	To accommodate the construction of a second northbound right-turn lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle StreetScore+ QOS would remain at QOS 4.

Because this improvement depends on the actions of Caltrans and the City of Menlo Park, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

Aside from an eastbound bicycle lane, there are no other bicycle or pedestrian facilities at this intersection. The northbound right-turn lane from the off-ramp to Sand Hill Road is currently protected, meaning vehicles are not permitted to turn right on red. The addition of a second northbound right-turn lane would not conflict with eastbound bicyclists if the right-turn lanes were to remain protected. Therefore, the mitigation measure would not adversely affect the existing bicycle lanes on Sand Hill Road. The San Mateo County *Comprehensive Bicycle and Pedestrian Plan* identifies interchange improvements at I-280 and Sand Hill Road.

Pedestrians interested in walking across the interchange must do so on the northern bridge that carries westbound traffic. The proposed mitigation measure would have no effect on pedestrian quality of service as pedestrians are not allowed at the intersection.

5.1.2.4 City of East Palo Alto

No significant intersection impacts were identified in the City of East Palo Alto, under the Background (2018) With Housing Alternatives scenario.

5.1.2.5 Town of Atherton

No significant intersection impacts were identified in the Town of Atherton, under the Background (2018) With Housing Alternatives scenario.

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 Highway Capacity Manual, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
5. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 Highway Capacity Manual.
6. Based on average pedestrian StreetScore+ Quality of Service of all intersection legs. See Appendix H for calculations.
7. Based on average bicycle StreetScore+ Quality of Service of all intersection legs. See Appendix H for calculations.
8. LTS = less-than-significant with mitigation; SU = significant and unavoidable; LTS/SU = less-than-significant with mitigation, but is either (1) located outside Santa Clara County where mitigation measures depend on funding and actions by other jurisdictions, or (2) located in Santa Clara County but depends on other funding for the mitigation to be constructed and thus the mitigation measure may not be implemented in a timely manner to avoid the impact. Significance determination is based on draft mitigation and responsible jurisdiction of the intersection.

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 Highway Capacity Manual, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
5. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 Highway Capacity Manual.
6. Based on average pedestrian StreetScore+ Quality of Service of all intersection legs. See Appendix H for calculations.
7. Based on average bicycle StreetScore+ Quality of Service of all intersection legs. See Appendix H for calculations.
8. LTS = less-than-significant with mitigation; SU = significant and unavoidable; LTS/SU = less-than-significant with mitigation, but is either (1) located outside Santa Clara County where mitigation measures depend on funding and actions by other jurisdictions, or (2) located in Santa Clara County but depends on other funding for the mitigation to be constructed and thus the mitigation measure may not be implemented in a timely manner to avoid the impact. Significance determination is based on draft mitigation and responsible jurisdiction of the intersection.

5.1.3 CUMULATIVE (2035) WITH HOUSING ALTERNATIVES CONDITIONS

Table 4-1 shows the delays, LOS results, and changes in critical volume-to-capacity ratio and delay used to identify significant intersection impacts under Cumulative (2035) with Housing Alternatives Conditions. Based on the impact criteria listed in Chapter 3 of TIA Part 2, the Full Offset and Half Offset Housing Alternatives would have significant impacts at the following 23 and 21 intersections, respectively (asterisks indicate if an impact was identified under only one housing alternative):

- Intersection #2: I-280 NB Off-Ramp/Sand Hill Road (AM peak hour)
- Intersection #17: Junipero Serra Blvd./Foothill Expressway/Page Mill Road (AM and PM peak hours)
- Intersection #19: Hanover Street/Page Mill Road (AM peak hour)
- Intersection #20: El Camino Real/Page Mill Road-Oregon Expressway (AM and PM peak hours)
- Intersection #21: Middlefield Road/Oregon Expressway (AM peak hour)
- Intersection #29: Foothill Expressway/Hillview Avenue (AM peak hour)
- Intersection #30: Foothill Expressway/Arastradero Road (AM and PM peak hours)
- Intersection #31: Foothill Expressway/San Antonio Road (PM peak hour)
- Intersection #32: Foothill Expressway/El Monte Avenue (AM peak hour)
- Intersection #33: Foothill Expressway/Springer Road-Magdalena Avenue (AM peak hour)
- Intersection #34: Bowdoin Street/Stanford Avenue (PM peak hour)*
- Intersection #37: El Camino Real/Encinal Avenue (PM peak hour)
- Intersection #38: El Camino Real/Valparaiso Avenue (PM peak hour)
- Intersection #41: El Camino Real/Ravenswood Road (PM peak hour)
- Intersection #48: El Camino Real/Embarcadero Road (PM peak hour)
- Intersection #56: Alma Street/Hamilton Avenue (PM peak hour)
- Intersection #58: Alma Street/Charleston Road (AM and PM peak hours)
- Intersection #59: Middlefield Road/Marsh Road (AM peak hour)
- Intersection #63: Middlefield Road/Lytton Avenue (PM peak hour)
- Intersection #66: Middlefield Road/Embarcadero Road (AM and PM peak hours)
- Intersection #69: Middlefield Road/ Charleston Road (PM peak hour)*
- Intersection #89: Central Expressway/Castro Street-Moffett Boulevard (PM peak hour)
- Intersection #90: Foothill Expressway/Edith Avenue (PM peak hour)

*Full Offset Housing Alternative Impact ONLY

The Full Offset Housing Alternative would make a cumulatively considerable contribution to significant impacts at two more intersections than the proposed 2018 General Use Permit: Intersections #34 (Bowdoin

Street/ Stanford Avenue) and #69 (Middlefield Road/ Charleston Road). In addition, the Full Offset Alternative would make a cumulatively considerable contribution to both AM and PM peak hour significant impacts at Intersection #58 (Alma Street/ Charleston Road), while the proposed 2018 General Use Permit would make a cumulatively considerable contribution only in the PM peak hour. At Intersection #89 (Central Expressway/ Castro Street-Moffett Boulevard) the Full Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the PM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in the AM peak hour. At Intersection #33 (Foothill Expressway/ Springer Road- Magdalena Avenue), the Full Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the AM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in both peak hours.

Generally, at the study intersections located closest to the campus, the Full Offset Housing Alternative would increase congestion compared to the proposed Project. At the study intersections located farther from the campus, the Full Offset Housing Alternative would reduce congestion by a small degree compared to the proposed Project because peak hour, peak direction residence-based trips are assumed to start and end at destinations closer to the Stanford campus as compared to peak hour, peak direction commute trips. When compared to the proposed Project, the Full Offset Alternative would add approximately 200 to 220 peak hour trips to intersections directly adjacent to the campus along El Camino Real and between 30 to 130 peak hour trips to intersections that border the campus along Sand Hill Road and Junipero Serra Boulevard. Overall, the Full Offset Housing Alternative would not reduce significant effects of the proposed 2018 General Use Permit under Cumulative (2035) conditions.

The Half Offset Alternative would make a cumulatively considerable contribution to both AM and PM peak hour significant impacts at Intersection #58 (Alma Street/ Charleston Road), while the proposed 2018 General Use Permit would make a cumulatively considerable contribution only in the PM peak hour. At Intersection #89 (Central Expressway. Castro Street-Moffett Boulevard) the Half Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the PM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in the AM peak hour. At Intersection #33 (Foothill Expressway/ Springer Road- Magdalena Avenue), the Half Offset Housing Alternative would make a cumulatively considerable contribution to a significant impact in the AM peak hour, while the proposed 2018 General Use Permit would make a cumulatively considerable contribution in both peak hours.

Generally, at the study intersections located closest to the campus, the Half Offset Housing Alternative would increase congestion compared to the proposed Project. At the study intersections located farther from the campus, the Half Offset Housing Alternative would reduce congestion by a small degree compared to the proposed Project because peak hour, peak direction residence-based trips are assumed to start and end at destinations closer to the Stanford campus as compared to peak hour, peak direction commute trips. When compared to the proposed Project, the Half Offset Alternative would add

approximately 110 peak hour trips to intersections directly adjacent to the campus along El Camino Real and between 10 to 60 peak hour trips to intersections that border the campus along Sand Hill Road and Junipero Serra Boulevard. Overall, the Half Offset Housing Alternative would not reduce significant effects of the proposed 2018 General Use Permit under Cumulative (2035) conditions.

Where feasible physical capacity improvements or other operational improvements are possible, they have been identified, and are described below, along with the post-mitigation level of service and resulting impact level of significance. A bicycle and pedestrian QOS evaluation was performed for each mitigation location, to assess the impacts on bicycle and pedestrian conditions of the proposed mitigation, using the methodology described in Chapter 3 of TIA Part 2. These impacts are also described below. **Table 5-3** and **Table 5-4** summarize all of this information, for the impacted locations for the Full Offset and Half Offset Alternatives, respectively. **Appendix G** contains the mitigation LOS calculations. **Appendix H** shows the bicycle and pedestrian StreetScore+ QOS results for each location.

5.1.3.1 Santa Clara County

Junipero Serra Boulevard-Foothill Expressway/Page Mill Road (Intersection #17) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an unacceptable LOS F during the AM and PM peak hours. This intersection would continue to function at LOS F under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors that connect to I-280, and provides a parallel route to I-280. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternatives to an already-congested intersection in 2035.

The following physical improvements are capable of reducing this impact:

- For the proposed 2018 General Use Permit, the impact at this intersection would be reduced to a less-than-significant level with the following mitigation: Contribute fair share funding toward
    - (1) addition of a third through lane on Page Mill Road in the westbound direction (for a total of two left-turn lanes, three through lanes and a right turn lane (plus a bike lane));
    - (2) addition of a receiving lane to westbound Page Mill Road (resulting in three lanes from Junipero Serra Boulevard approximately to Old Page Mill Road); and
    - (3) installation of an overlap phase for northbound and southbound right-turning vehicles and widening of the southbound approach to two lanes between Page Mill Road and Stanford Avenue to align with the existing designated right-turn lane.[8]
- For the Full Offset Housing Alternative, the impact at this intersection cannot be mitigated to a less-than-significant level with the mitigation proposed for the Project. Instead, the following mitigation would be needed: Contribute fair share funding toward the grade separation project at this intersection identified in the *County Expressway Plan 2040*.
- For the Half Offset Housing Alternative, the impact at this intersection cannot be mitigated to a less-than-significant level with the mitigation proposed for the Project. Instead, the following additional mitigation would be needed to mitigate the impact: Contribute fair share funding toward installation of an overlap phase for the westbound right-turn lane.

Full Offset Mitigation Findings	Half Offset Mitigation Findings
Although the configuration of this proposed interchange has yet to be determined, additional right-of-way would be required to construction this improvement. Modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings With the exception of construction-related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. Pedestrian QOS would improve from QOS 4 to QOS 2.5.	The new westbound improvements would require some right of way (10-12 feet) from the subdivision corner (northeast) and along the dish parcel for the receiving lane (northwest). Installation of an overlap phase for northbound, southbound, and westbound right-turning vehicles would be accommodated through the modification of the existing traffic signal, which requires no additional right-of-way. Widening the southbound approach to two lanes between Page Mill Road and Stanford Avenue will likely require the acquisition of additional right-of-way. This improvement would allow southbound right-turning vehicles additional queuing space so southbound through vehicles do not block the right-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.5 and QOS 4, respectively.

Because the provision of these improvements may require additional funding that has not yet been identified, Santa Clara County may find that the improvements would not be implemented in a timely

manner such that the Housing Alternative's impact is mitigated. Therefore, the impact would remain **significant and unavoidable.**

Grade separation of Page Mill Road at Junipero Serra Boulevard was identified as a Tier 3 improvement in the *County Expressway Plan 2040*. The grade separation improvements were identified as mitigation for the Full Offset Housing Alternative in order to bring the intersection impact to a less-than-significant level. Right-turn lanes and high vehicle speeds would continue to cause uncomfortable situations for bicyclists at the intersection. However, the mitigation would cause pedestrian QOS to improve from QOS 4 to QOS 2.5. With the proposed mitigation, the pedestrian crossing distances at the northbound and southbound approaches would be reduced from the existing 6+ lanes to an estimated 2 to 3 lanes, providing more comfortable pedestrian crossing conditions at the intersection.

With the proposed Half Offset Housing Alternative mitigation, a second lane would be added traveling southbound between Stanford Avenue and Page Mill Road, aligning with the existing designated southbound right-turn lane at Page Mill Road, and would not impact the existing intersection configuration of the southbound approach. A third through lane would be added to the westbound approach and continued on the westbound receiving lanes, requiring additional right-of-way, and increasing the pedestrian crossing distance on the east and west legs of the intersection. In addition, the north/south bicycle crossing distances would increase slightly due to the additional through lane while maintaining but not exacerbating the current uncomfortable conditions for bicyclists and pedestrians at the intersection.

It is noted that there is a Tier 1 improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040* to widen Page Mill Road from just east of Junipero Serra Boulevard-Foothill Expressway to the I-280 ramps. The Tier 1 improvement is fully funded through Measure B but conservatively is not anticipated to be in place by 2035. This was evaluated as a potential mitigation measure and was determined not bring the impact to a less-than-significant level under 2035 Conditions.

Hanover Street/Page Mill Road (Intersection #19) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Page Mill Road serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on the local roadway

[8] The third improvement was identified as a mitigation measure in the Draft EIR. Two additional improvements have been added to ensure the impact is mitigated to a less-than-significant level under the assumption that Page Mill Road is four lanes, rather than six lanes as previously depicted in the VTA 2040 model.

network. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward installation of a second westbound left-turn lane, identified as an option in the *Page Mill Expressway Corridor Study Report*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a second westbound left-turn lane, the westbound approach would be widened from three to four lanes and may require the removal of the center median, reduction in lane width, and/or reduction in bicycle lane width at the intersection. The City of Palo Alto has adequate right-of-way to accommodate the dual westbound left-turn lanes and associated receiving lanes on Hanover Street. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	To accommodate the construction of a second westbound left-turn lane, the westbound approach would be widened from three to four lanes and may require the removal of the center median, reduction in lane width, and/or reduction in bicycle lane width at the intersection. The City of Palo Alto has adequate right-of-way to accommodate the dual westbound left-turn lanes and associated receiving lanes on Hanover Street. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings	Quality of Service Findings
The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 4 and QOS 3, respectively.	The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 4 and QOS 3, respectively.

However, because the provision of this improvement may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, limited bicycle infrastructure on the north/south approaches would remain as well as the intersection crossing distance, maintaining but not exacerbating the current uncomfortable conditions for bicyclists at the intersection. Pedestrian crossing distances would be unchanged (curb-to-curb) on all approaches. The proposed mitigation measure would not create additional conflicts for the City of Palo Alto's proposed Class I facility on the south side of Page Mill Road as identified in their *Bicycle and Pedestrian Transportation Plan*.

It is noted that there is a Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040*. The improvement is to convert the signal phasing to an eight-phase signal. This improvement is not anticipated to reduce the Housing Alternative's impact to a less-than-significant level. Therefore, it was not identified as a potential mitigation measure. The proposed mitigation measure does not conflict with the County's Tier 1 intersection improvement.

El Camino Real/Page Mill Road-Oregon Expressway (Intersection #20) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM and PM peak hours. It would continue to function at LOS E in the AM peak hour under Cumulative (2035) No Project Conditions, but it would function at unacceptable LOS F in the AM peak hour under Cumulative (2035) With Housing Alternatives Conditions. In addition, it would function at unacceptable LOS F in the PM hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions where Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors, one connecting to I-280 and US 101 and the other traversing the peninsula and south bay. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested intersection in 2035.

The following physical improvements are capable of reducing this impact:

- For the proposed 2018 General Use Permit, the impact at this intersection would be reduced to a less-than-significant level with the following mitigation: Contribute fair-share funding toward the reconfiguration of the east leg of the intersection to include one right-turn lane, two through lanes, two extended left-turn lanes, two receiving lanes, and no on-street parking; and to the extension of the double left-turn lanes as identified in the *Page Mill Expressway Corridor Study Report*.
- For the Full Offset and Half Offset Housing Alternatives, the impact at this intersection would be reduced to a less-than-significant level with the following additional mitigation: Install a designated southbound right-turn lane with an overlap phase.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the reconfiguration of the east leg of the intersection, parking would need to be removed along the south side of Page Mill Road and the median island would need to be shifted further to the south to accommodate the additional westbound lane. Little to no right-of-way would be needed to accommodate this improvement; however, an easement on the north side of the roadway to preserve the sidewalk width would be needed, and the existing bus stop located on the southeast corner of the intersection on Oregon Expressway may need to be relocated or further addressed during design. To accommodate the southbound right-turn lane, parking would need to be removed and the eastbound U-turn movement would need to be restricted. This would limit the access to some of the parcels along Page Mill Road. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	To accommodate the reconfiguration of the east leg of the intersection, parking would need to be removed along the south side of Page Mill Road and the median island would need to be shifted further to the south to accommodate the additional westbound lane. Little to no right-of-way would be needed to accommodate this improvement; however, an easement on the north side of the roadway to preserve the sidewalk width would be needed, and the existing bus stop located on the southeast corner of the intersection on Oregon Expressway may need to be relocated or further addressed during design. To accommodate the southbound right-turn lane, parking would need to be removed and the eastbound U-turn movement would need to be restricted. This would limit the access to some of the parcels along Page Mill Road. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 4.	Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 4.

These improvements are identified in Santa Clara County's *Page Mill Corridor Expressway Plan*, and the extension of the double westbound left-turn lanes is identified as a Tier 1 improvement in the draft *Santa Clara County Expressway Plan 2040* along with enhanced pedestrian facilities on the southwest and southeast corners of the intersection. The Tier 1 improvements are fully funded through Measure B. However, because the provision of the remaining improvements may require additional funding that has not yet been identified and all improvements at this intersection would require approval from Caltrans, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable.**

With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions assuming the parking is removed next to the eastbound receiving lanes and along the southbound approach, with right-turn slip lanes and/or high vehicle turning speeds preserving uncomfortable environments at the intersection. The proposed mitigation measure would not conflict with the City of Palo Alto's *Bicycle and Pedestrian Transportation Plan* to implement a Class III facility on Oregon Expressway east of the intersection.

Middlefield Road/Oregon Expressway (Intersection #21) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Cumulative (2035) No Project Conditions and under Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more in the AM peak hour. This intersection serves two major corridors, one connecting to I-280, El Camino Real, and US 101, and the other traversing the City of Palo Alto and adjacent communities. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested intersection in 2035.

Due to the close proximity of the Oregon Avenue frontage road and the County's desire to preserve the shoulder striping along Oregon Expressway for use by bicyclists, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

Foothill Expressway/Hillview Avenue (Intersection #29) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

Due to the close proximity of the Miranda Avenue/Hillview Avenue intersection and lack of improvement identified in the Santa Clara *County Expressway Plan 2040* at this intersection, no feasible mitigation

measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle StreetScore+ QOS would not be affected.

Foothill Expressway/Arastradero Road (Intersection #30) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour and LOS F in the PM peak hour. It would function at unacceptable LOS F in the AM and PM peak hours under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would decrease the average critical delay in the PM peak hour and increase the average critical delay by more than four seconds in the AM peak hour and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors, one connecting to I-280, El Camino Real, and US 101, and the other connecting the Cities of Menlo Park, Palo Alto, Los Alto and Mountain View. As such, the intersection serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested intersection in 2035.

The following physical improvements are capable of reducing this impact:

- If such grade separation is approved and implemented, contribute fair-share funding toward grade separation as identified in the draft *Santa Clara County Expressway Plan 2040*. The grade separation assumed for purposes of analysis includes a separated throughway for vehicles on Foothill Expressway.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
Although the configuration of this proposed interchange has yet to be determined, additional right-of-way would be required to construct this improvement. Due to the close proximity of the Miranda Avenue/Arastradero Road intersection, additional modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	Although the configuration of this proposed interchange has yet to be determined, additional right-of-way would be required to construct this improvement. Due to the close proximity of the Miranda Avenue/Arastradero Road intersection, additional modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings With the exception of construction related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. However, the mitigation would cause pedestrian QOS to improve from QOS 4 to QOS 2.5.	Quality of Service Findings With the exception of construction related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. However, the mitigation would cause pedestrian QOS to improve from QOS 4 to QOS 2.5.

Because this Tier 3 improvement has not undergone CEQA review, may not be approved, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement

would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

Right-turn lanes and high vehicle speeds would continue to cause uncomfortable conditions for bicyclists at the intersection. With the proposed mitigation, the pedestrian crossing distances at the northbound and southbound approaches would be reduced from the existing 6+ lanes to an estimated three lanes, providing more favorable pedestrian crossing conditions at the intersection.

Foothill Expressway/San Antonio Road (Intersection #31) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the PM peak hour. It would continue to function at LOS E in the PM peak hour under Cumulative (2035) No Project Conditions, but would function at unacceptable LOS F in the PM peak hour under Cumulative (2035) With Housing Alternatives Conditions. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2018.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the construction of a third southbound through lane on Foothill Expressway between San Antonio Road and El Monte Avenue as identified in the draft *Santa Clara County Expressway Plan 2040*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
A third receiving lane would be added on the south leg of Foothill Expressway as identified as a Tier 1 improvement in the *Santa Clara County Expressway Plan 2040* to extend the southbound right-turn lane from El Monte Avenue to San Antonio Road, which will likely require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	A third receiving lane would be added on the south leg of Foothill Expressway as identified as a Tier 1 improvement in the *Santa Clara County Expressway Plan 2040* to extend the southbound right-turn lane from El Monte Avenue to San Antonio Road, which will likely require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings	Quality of Service Findings
The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle QOS would remain unchanged at QOS 4.	The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle QOS would remain unchanged at QOS 4.

Because this improvement would require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, right-turn slip lanes and high vehicle turning speeds would remain, maintaining the current uncomfortable environments for bicyclists at the intersection. There is no pedestrian access at this intersection; therefore, the proposed mitigation measure would have no effect on pedestrian quality of service.

It is noted that the full Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040* includes widening Foothill Expressway from four to six lanes between San Antonio Road and El Monte Avenue. The proposed mitigation implements the southbound widening.

Foothill Expressway/El Monte Avenue (Intersection #32) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at LOS F under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more in the AM peak hour. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the construction of a third northbound through lane at the intersection and associated receiving lane as identified in the draft *Santa Clara County Expressway Plan 2040*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a third northbound through lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. The receiving lanes on the north side of the intersection would also need to be widened as identified as a Tier 1 improvement in the *Santa Clara County Expressway Plan 2040* to extend the northbound right-turn lane from San Antonio Road to El Monte Avenue, which will likely require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	To accommodate the construction of a third northbound through lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. The receiving lanes on the north side of the intersection would also need to be widened as identified as a Tier 1 improvement in the *Santa Clara County Expressway Plan 2040* to extend the northbound right-turn lane from San Antonio Road to El Monte Avenue, which will likely require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings	Quality of Service Findings
The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian QOS would remain unchanged, at QOS 4 (for both).	The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian QOS would remain unchanged, at QOS 4 (for both).

The Tier 1 improvements are fully funded through Measure B. Because the remainder of these improvements would require additional funding that has not yet been identified, Santa Clara County may find that this improvement will not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The east/west bicycle and pedestrian crossing distances would increase slightly due to the additional through lane and continue to have right-turn slip lanes and high vehicle turning speeds, while maintaining the current quality of service score.

It is noted that the full Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040* Includes widening Foothill Expressway from four to six lanes between San Antonio Road and El Monte Avenue. The proposed mitigation implements the northbound widening, but the southbound widening, although would increase the available storage capacity, would not reduce the Housing Alternative's AM peak hour impact to a less-than-significant level. Therefore, the southbound widening was not identified as a potential mitigation measure at this intersection.

Foothill Expressway/Springer Road–Magdalena Avenue (Intersection #33) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, it functions at an acceptable LOS E in the AM and PM

peak hours. It would function at unacceptable LOS F in the AM and PM peak hours under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the following improvements:
    - Convert to an eight-phase signal as identified in the draft *Santa Clara County Expressway Plan 2040*
    - Change the lane configuration for the east leg to have two left-turn lanes, one through lane, and one right-turn lane
    - Change the lane configuration for the west leg to have one left-turn lane, two through lanes, and one right-turn lane.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
Converting the existing phasing to an eight-phase signal with the associated lane configuration changes above is identified as a Tier 2 improvement in the Santa Clara County *Expressway Plan 2040*. In order to accommodate an eight-phase signal, the eastbound and westbound left-turn movements would require designated left-turn lanes and may require the acquisition of additional right-of-way. The above mitigation measure would reduce the Housing Alternative's impact to a less-than-significant level while also incorporating the Tier 2 improvement. In order to accommodate this improvement, the center median on the west leg of the intersection would need to be shifted to incorporate a designated left-turn lane and remove one receiving lane from the west leg. The eastbound approach would require re-striping to change the shared left-turn/through lane to a designated left-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.	Converting the existing phasing to an eight-phase signal with the associated lane configuration changes above is identified as a Tier 2 improvement in the Santa Clara County *Expressway Plan 2040*. In order to accommodate an eight-phase signal, the eastbound and westbound left-turn movements would require designated left-turn lanes and may require the acquisition of additional right-of-way. The above mitigation measure would reduce the Housing Alternative's impact to a less-than-significant level while also incorporating the Tier 2 improvement. In order to accommodate this improvement, the center median on the west leg of the intersection would need to be shifted to incorporate a designated left-turn lane and remove one receiving lane from the west leg. The eastbound approach would require re-striping to change the shared left-turn/through lane to a designated left-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level.
Quality of Service Findings	Quality of Service Findings
The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 3.5 and QOS 4, respectively.	The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 3.5 and QOS 4, respectively.

However, because the provision of this improvement may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable.**

With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions, with right-turn slip lanes and high vehicle turning speeds maintaining the current uncomfortable environment at the intersection. To construct the designated eastbound left-turn lane, the eastbound lanes will be narrowed and the center median may be reduced resulting in the same curb-to-curb width, but increasing the number of travel lanes. The proposed mitigation would not adversely affect the City of Los Alto's existing Class II bicycle facilities at the Foothill Expressway/Springer Road-Magdalena Avenue intersection.

It is noted that the full Tier 2 intersection improvement identified for this intersection in the draft Santa Clara County Expressway Plan 2040 includes converting to an eight-phase signal, operational/safety improvements at the County Club Drive intersection, and potentially adding a signal at the adjacent Berry Avenue intersection. The proposed mitigation implements the eight-phase signal and associated lane configuration changes at the intersection.

Central Expressway/Castro Street-Moffett Boulevard (Intersection #89) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at LOS F under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Central Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including US 101. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Close Castro Street at the train tracks to form a T-intersection of Central Expressway and Moffett Boulevard, consistent with recommendations in the *Mountain View Transit Center Master Plan (May 2017)*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
This improvement will not require any additional right-of-way if implemented by the City of Mountain View. Given that this is the City's preferred improvement and would reduce the Housing Alternative's impact to a ***less-than-significant*** level, the closure of Castro Street is the identified mitigation measure at this intersection; if Castro Street is closed, Stanford would not need to contribute to any improvements at this intersection.	This improvement will not require any additional right-of-way if implemented by the City of Mountain View. Given that this is the City's preferred improvement and would reduce the Housing Alternative's impact to a ***less-than-significant*** level, the closure of Castro Street is the identified mitigation measure at this intersection; if Castro Street is closed, Stanford would not need to contribute to any improvements at this intersection.
Quality of Service Findings	Quality of Service Findings
The mitigation is anticipated to improve bicycle and pedestrian QOS; the bicycle QOS would shift from 3.3 to 1.7 and the pedestrian QOS would shift from 4 to 2.	The mitigation is anticipated to improve bicycle and pedestrian QOS; the bicycle QOS would shift from 3.3 to 1.7 and the pedestrian QOS would shift from 4 to 2.

It is noted that there is a Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040*. The improvement is to grade separate the train tracks from the intersection. Although this improvement would increase the available capacity at the intersection and would reduce the Housing Alternative's impact to a less-than-significant level, the City of Mountain View has approved plans to close Castro Street (the west leg) at the train tracks, which would change the current four-leg intersection to a T-intersection of Central Expressway and Moffett Boulevard. Because this improvement would require approval from the City of Mountain View, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the closure of Castro Street, pedestrian and bicycle crossings will be moved to a separated underground facility to cross Central Expressway and the Caltrain tracks with the exception of the east leg of the intersection where pedestrian crossings would still occur at grade. Northbound and southbound bicyclists would continue to travel on Central Expressway, but bicyclists traveling from Moffett Boulevard to Castro Street would use the underground crossing.

If the closure of Castro Street is not implemented in a timely manner and/or the City of Mountain View does not pursue the improvement, a second back-up mitigation measure is proposed. The following secondary physical improvements are capable of reducing this impact to a less than significant level:

- Int. #89 Mitigation Alternative: If the City of Mountain View does not close Castro Street, contribute fair-share funding toward the construction of a second southbound left-turn lane from Central Expressway to Moffett Boulevard.

To accommodate the construction of a second southbound left-turn lane, the Central Expressway center median would need to be reduced and/or removed, and the improvement would not require any additional right-of-way. Given the existing and proposed geometry, signal timings may also need to be adjusted to lead-lag lefts to account for potential truck turn conflicts. With this mitigation, the impact would be reduced to a less-than-significant level. Because this improvement would require approval from the City of Mountain View, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain significant and unavoidable.

Foothill Expressway/Edith Avenue (Intersection #90) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Santa Clara County signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the PM peak hour. It would function at unacceptable LOS F in the PM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

Due to the close proximity of the residential units and retail space near the intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

5.1.3.2 City of Palo Alto

Bowdoin Street/Stanford Avenue (Intersection #34) – The addition of Housing Alternatives traffic under Cumulative (2035) With Full Offset Housing Alternative Conditions would cause a significant impact based on the significance criteria for an unsignalized intersection during the PM peak hour. Under Existing Conditions, it functions at an acceptable LOS C in the PM peak hour. It would function at acceptable LOS D in the PM peak hour under Cumulative (2035) No Project Conditions, but would function at unacceptable LOS F and meet the CA MUTCD peak hour signal warrant in the PM peak hour under Cumulative (2035) With Full Offset Housing Alternative Conditions. This intersection serves as an access point to the Stanford campus, specifically the residential areas of Stanford's campus.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the construction of a traffic signal.

Full Offset Housing Alternative Mitigation Findings	Half Offset Mitigation Findings
Installation of a traffic signal would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on pedestrian QOS; the bicycle StreetScore+ QOS would improve from 1.5 to 1. The current bicycle StreetScore+ value would remain at QOS 2.	Not impacted under Half Offset Alternative. Quality of Service Findings N/A

However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, pedestrian crossing distances would remain unchanged (one lane in each direction) in all directions. A signal would provide protected crossing times for pedestrians, which increases their quality of service compared to an uncontrolled pedestrian crossing. Bicycle quality of service is estimated to remain high with the introduction of a signal. The Class II bicycle facilities would remain in place although design of this intersection will need to ensure that bicycle detection and other features are provided.

El Camino Real/Embarcadero Road (Intersection #48) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto / Santa Clara County CMP signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at acceptable LOS E in the PM peak hour under Cumulative (2035) No Project Conditions, but would function at unacceptable LOS F in the PM peak hour under Cumulative (2035) With Housing Alternatives Conditions. This intersection serves two major corridors, one connecting to US 101 and the other traversing the peninsula and south bay. The intersection serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested intersection in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a second northbound left-turn lane.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a second northbound left-turn lane, the northbound approach would be widened from four to five lanes by potentially reducing the lane widths, reducing the width of the center median, and/or removing on-street parking for the length of the additional left-turn pocket and taper. Right-of-way may be required to accommodate the second northbound left-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 3.8 and QOS 4, respectively.	To accommodate the construction of a second northbound left-turn lane, the northbound approach would be widened from four to five lanes by potentially reducing the lane widths, reducing the width of the center median, and/or removing on-street parking for the length of the additional left-turn pocket and taper. Right-of-way may be required to accommodate the second northbound left-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 3.8 and QOS 4, respectively.

However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto and Caltrans, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**.

The VTA El Camino Real Bus Rapid Transit (BRT) Project would upgrade the 522 Rapid Bus Route to have Bus Rapid Transit status. The geometric alternatives included in the draft Environmental Impact Report for the BRT Project do not include a separate bus lane through this intersection. Some alternatives studied include the creation of outboard bus lanes through the removal of parking on the south side of El Camino Real. Since there is no final design for this intersection and the BRT project completion data is uncertain, it is not possible to determine what, if any, effect of the mitigation would have on the BRT Project. However, the existing bus stop on the northeast corner on El Camino Real may block through traffic when boarding and alighting passengers if the proposed mitigation measure is built. This is typical for bus stops on El Camino Real and other major arterials.

With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions, but would add an additional travel lane on the south leg of the intersection, with right-turn slip lanes and high vehicle turning speeds maintaining the current uncomfortable environment at the intersection. This proposed mitigation would not adversely affect the City of Palo Alto's proposed Class III facilities as identified in their *Bicycle and Pedestrian Transportation Plan*. It should be noted that the City is currently designing bicycle improvements at this intersection.

Alma Street/Hamilton Avenue (Intersection #56) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS B in the PM peak hour. It would function at unacceptable LOS E in the PM peak hours under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Alma Street provides a key north-south connection in Palo Alto and communities to the south, and given the limited capacity on parallel routes such as El Camino Real, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the reconfiguration of the westbound approach to have one left-turn lane and one right-turn lane, by removing on-street parking.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
By removing on-street parking, the reconfiguration of the westbound approach to have one left-turn lane and one right-turn lane would not require the acquisition of additional right-of-way, but would require the removal of potentially four on-street parking spaces on the north side of Hamilton Avenue. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 2.5 and QOS 2, respectively.	By removing on-street parking, the reconfiguration of the westbound approach to have one left-turn lane and one right-turn lane would not require the acquisition of additional right-of-way, but would require the removal of potentially four on-street parking spaces on the north side of Hamilton Avenue. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 2.5 and QOS 2, respectively.

However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions, with a single right-turn lane in the westbound direction and low vehicle turning speeds, preserving a generally comfortable environment at the intersection. This proposed mitigation would not adversely affect the City of Palo Alto's proposed Class III facilities as identified in their *Bicycle and Pedestrian Transportation Plan*.

Alma Street/Charleston Road (Intersection #58) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS F in the PM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors serving Palo Alto and Mountain View, including connections to US 101, El Camino Real and I-280. As such, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a designated right-turn lane and install an overlap phase for the northbound and southbound right-turn movements.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a designated northbound right-turn lane, the northbound approach would need to be widened and will likely require the acquisition of additional right-of-way. Installation of an overlap phase for northbound and southbound right-turning vehicles would be accommodated through the modification of the existing traffic signal. With this mitigation, the level of service would be improved and the impact would be reduced, but not to a less than significant level. Therefore, the impact would remain **significant and unavoidable**.	To accommodate the construction of a designated northbound right-turn lane, the northbound approach would need to be widened and will likely require the acquisition of additional right-of-way. Installation of an overlap phase for northbound and southbound right-turning vehicles would be accommodated through the modification of the existing traffic signal. With this mitigation, the level of service would be improved and the impact would be reduced, but not to a less than significant level. Therefore, the impact would remain **significant and unavoidable**.
Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.3 and QOS 3.5, respectively.	Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.3 and QOS 3.5, respectively.

However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**. In addition, this impact would be significant and unavoidable because the identified mitigation measure would not reduce the impact to a less-than-significant level.

With the proposed mitigation, pedestrian crossing distances would increase slightly on the south leg of the intersection and remain unchanged on all other approaches while maintaining the current quality of service score at the intersection. Bicycle lanes on the eastbound and westbound approaches, and low right-turn speeds would remain, resulting in slightly better conditions compared to what bicyclists experience on the northbound and southbound approaches. The proposed mitigation measure would not conflict with the City of Palo Alto's proposed Class III facility along Alma Street as identified in the City of Palo Alto *Bicycle & Pedestrian Transportation Plan*. With a Class III facility, bicyclists travel in the vehicle lane and do not require a separated space as with a bicycle lane.

Middlefield Road/Lytton Avenue (Intersection #63) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact under the Half Offset Alternative based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour under the Half Offset Alternative. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the PM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Half Offset Alternative Conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Middlefield Road provides a key north-south connection in Palo Alto and communities to the north and south, and given the limited capacity on parallel routes such as El Camino Real, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

Due to the close proximity of the residential units near the intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

It is noted that a mitigation was identified for this intersection in the *Menlo Park Facebook Campus Expansion Project FEIR (November 2016)*. The mitigation was to add a second eastbound left-turn lane. However, because of the inability to widen the roadway due to the close proximity of the residential units, it is considered infeasible.

Middlefield Road/Embarcadero Road (Intersection #66) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions causes a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS C and D in the AM and PM peak hours, respectively. It would function at unacceptable LOS E in the AM and PM peak hours under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives conditions. Housing Alternatives-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two key transportation corridors connecting to US 101 and El Camino Real, and connecting Palo Alto to communities to the north

and south. As such, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

Based on the close proximity of the residential units near the intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

Middlefield Road/Charleston Road (Intersection #69) – The addition of Housing Alternatives traffic under Cumulative (2035) With Full Offset Housing Alternative Conditions causes a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the AM and PM peak hours under Cumulative (2035) No Project Conditions and Cumulative (2035) With Full Offset Housing Alternative conditions. Full Offset Housing Alternative-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two key transportation corridors connecting to US 101 and El Camino Real, and connecting Palo Alto to communities to the north and south. As such, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from the Full Offset Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a designated eastbound right-turn lane with an overlap phase.

Full Offset Housing Alternative Mitigation Findings	Half Offset Mitigation Findings
Installation of a right-turn lane would require additional right-of-way on the southwest corner of the intersection. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle QOS; the pedestrian StreetScore+ QOS would decrease slightly from 2 to 2.5. The current bicycle StreetScore+ value would remain at QOS 3.	Not impacted under Half Offset Alternative. Quality of Service Findings N/A

However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, bicycle and pedestrian southbound crossing distances would increase by approximately 10-12 feet with the addition of a right-turn lane resulting in a slightly less comfortable walking environment when crossing this leg of the intersection. This proposed mitigation would not adversely affect the City of Palo Alto's proposed Class II (Enhanced Bikeway) facilities as identified in their *Bicycle and Pedestrian Transportation Plan*.

5.1.3.3 City of Menlo Park

I-280 Northbound Off-Ramp/Sand Hill Road (Intersection #2) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions causes a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Cumulative (2035) No Project Conditions and under Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average delay on the eastbound through (local) approach by more than 0.8 seconds. The poor AM peak hour conditions in 2035 are the result of a substantial increase in traffic growth at the Sand Hill Road interchange, along with Housing Alternatives traffic primarily entering the northbound ramps intersection from the west (i.e. from the southbound off-ramp).

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a second northbound right-turn lane as identified in the *ConnectMenlo Final Environmental Impact Report*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
To accommodate the construction of a second northbound right-turn lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and QOS; the bicycle StreetScore+ QOS would remain at QOS 4.	To accommodate the construction of a second northbound right-turn lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and QOS; the bicycle StreetScore+ QOS would remain at QOS 4.

Because this improvement depends on the actions of Caltrans and the City of Menlo Park, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, limited infrastructure to accommodate bicycle and pedestrian crossings, coupled with high vehicle speeds along Sand Hill Road, create an uncomfortable condition for bicyclists and pedestrians at the intersection. Aside from an eastbound bicycle lane, there are no other bicycle or pedestrian facilities at this intersection. The northbound right-turn lane from the off-ramp to Sand Hill Road is currently protected; meaning vehicles are not permitted to turn right on red. The addition of a second northbound right-turn lane would not conflict with eastbound bicyclists if the right-turn lanes were to remain protected.

Pedestrians interested in walking across the interchange must do so on the northern bridge that carries westbound traffic. The proposed mitigation measure would have no effect on pedestrian quality of service as pedestrians are not allowed at the intersection.

El Camino Real/Encinal Avenue (Intersection #37) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the PM peak hour. It would function at unacceptable LOS F in the PM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average delay on the westbound right-turn (critical) movements by more than 0.8 seconds. El Camino Real is a major north-south corridor serving the peninsula and south bay, which serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the conversion of the northbound right-turn lane to a shared through/right-turn lane by removing on-street parking.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
By removing on-street parking on the east side of El Camino Real, the conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 2.8 and QOS 2.7, respectively.	By removing on-street parking on the east side of El Camino Real, the conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 2.8 and QOS 2.7, respectively.

Because this improvement depends on the actions of the City of Menlo Park and Caltrans, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, pedestrian crossing distances would remain unchanged (curb-to-curb) on all approaches. Low right-turn speeds and short right-turn lanes would remain, maintaining better conditions for bicyclists traveling along the eastbound and westbound approaches, compared to what bicyclists experience on El Camino Real. While the bicycle StreetScore+ QOS at the northbound approach will not improve, bicyclists will no longer move left across the right-turn conflict area and RTOR will be reduced, because vehicles will no long have a designated turn lane. The San Mateo *County Comprehensive Bicycle and Pedestrian Plan* (2011) proposes Class II facilities on El Camino Real between Valparaiso Avenue and Alejandra Avenue while the City of Menlo Park *Comprehensive Bicycle Development Plan* (2005) proposed Class III facilities on El Camino Real at Encinal Avenue. The proposed mitigation measure could conflict with a Class II facility (bicycle lane) if only on-street parking is removed in order to add a third through lane. However, if the center median were narrowed, space for a bicycle lane could be provided. The proposed mitigation measure would not conflict with a Class III facility. The existing bus stop on the northeast corner on El Camino Real may block through traffic when boarding and alighting passengers if the proposed mitigation measure is constructed. However, this is typical for bus stops on El Camino Real and other major arterials.

El Camino Real/Valparaiso Avenue (Intersection #38) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the PM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average delay on the eastbound left-turn and westbound through (critical) movements by more than 0.8 seconds. El Camino Real is a major north-south corridor serving the peninsula and south bay, which serves a large existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the conversion of the northbound right-turn lane to a shared through/right-turn lane by removing on-street parking.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
By removing on-street parking on the east side of El Camino Real, the conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; with the proposed mitigation, the bicycle and pedestrian StreetScore+ QOS would remain at QOS 3.3 and QOS 4, respectively.	By removing on-street parking on the east side of El Camino Real, the conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; with the proposed mitigation, the bicycle and pedestrian StreetScore+ QOS would remain at QOS 3.3 and QOS 4, respectively.

Because this improvement depends on the actions of the City of Menlo Park and Caltrans, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, pedestrian crossing distances would remain unchanged (curb-to-curb) across all legs of the intersection, maintaining the current uncomfortable crossing conditions. Bicycle lanes and low right-turn speeds would remain along Valparaiso Avenue, maintaining better conditions for bicyclists traveling along the eastbound and westbound approaches, compared to what bicyclists experience on El Camino Real. While the bicycle StreetScore+ QOS at the northbound approach would not improve, bicyclists would no longer move left across the right-turn conflict area and RTOR will be reduced because vehicles would no long have a designated turn lane. The San Mateo *County Comprehensive Bicycle and Pedestrian Plan* (2011) and the City of Menlo Park *Comprehensive Bicycle Development Plan* (2005) propose Class III facilities on El Camino Real at Valparaiso Avenue. The proposed mitigation measure would not conflict with a Class III facility.

El Camino Real/Ravenswood Road (Intersection #41) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the PM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase the average delay on the eastbound and westbound left-turn (critical movements by more than 0.8 seconds. El Camino Real is a major north-south corridor serving the peninsula and south bay, which serves a large

existing traffic volume and is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- For the proposed 2018 General Use Permit, the impact at this intersection would be reduced to a less-than-significant level with the following mitigation: Contribute fair-share funding toward the conversion of the northbound right-turn lane to a shared through/right-turn lane by removing on-street parking.
- For the Full Offset and Half Offset Housing Alternatives, the impact at this intersection would be reduced to a less-than-significant level with the following additional mitigation: Widen the eastbound approach on Menlo Avenue to include an exclusive left-turn lane as presented in the Final EIR for *500 El Camino Real*.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
The widening of Menlo Avenue would require additional right-of-way, however the northbound lane conversion would not require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.5 (for both).	The widening of Menlo Avenue would require additional right-of-way, however the northbound lane conversion would not require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.5 (for both).

Because this improvement depends on the actions of the City of Menlo Park and Caltrans, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, pedestrian crossing distances would remain unchanged (curb-to-curb) across all but the west leg of the intersection, maintaining the current crossing conditions. Pedestrians crossing the west leg of the intersection would experience an additional 10-12 feet of exposure while in the intersection. Bicycle routes and low right-turn speeds would remain along Ravenswood Road, maintaining better conditions for bicyclists traveling in the eastbound and westbound directions, compared to what bicyclists experience on El Camino Real. While the bicycle StreetScore+ QOS at the northbound approach will not improve, bicyclists would no longer move left across the right-turn conflict area and RTOR would be reduced because vehicles would no long have a designated turn lane. The San Mateo *County Comprehensive Bicycle and Pedestrian Plan* (2011) and the City of Menlo Park *Comprehensive Bicycle Development Plan* (2005) propose Class III facilities on El Camino Real at Valparaiso Avenue. The proposed mitigation measure would not conflict with a Class III facility.

5.1.3.4 City of East Palo Alto

No significant impacts are identified for East Palo Alto intersections.

5.1.3.5 Town of Atherton

Middlefield Road/Marsh Road (Intersection #59) – The addition of Housing Alternatives traffic under Cumulative (2035) With Housing Alternatives Conditions would cause a significant impact based on the significance criteria for a Town of Atherton signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the AM peak hour. It would function at unacceptable LOS E in the AM peak hour under Cumulative (2035) No Project Conditions and Cumulative (2035) With Housing Alternatives Conditions. Housing Alternatives-generated traffic would increase average critical delay by more than four seconds and increase the volume to capacity ratio by 0.01 or more. This intersection serves a key north-south connector roadway in the region, and a key connecting roadway which provides access to US 101. As such, it is projected to serve substantial traffic growth from other regional generators. The significant impact is thus the result of adding traffic from either Housing Alternative to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Contribute fair-share funding toward the addition of a second westbound left-turn lane and add a second receiving lane on the south leg, consistent with the recommendations in the *ConnectMenlo Final EIR (November 2016*) and the *Middle Plaza at 500 El Camino Real Draft EIR (March 2017)*.
- This same mitigation measure was identified for the proposed Project.

Full Offset Housing Alternative Mitigation Findings	Half Offset Housing Alternative Mitigation Findings
Right-of-way acquisition would be required to accommodate the construction of a second westbound left-turn lane and a second receiving lane on the south leg. This mitigation measure may also be found in the Facebook Campus Expansion FEIR and the Menlo Gateway FEIR. The Town of Atherton has preliminary plans to redesign the intersection. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The proposed mitigation would cause the bicycle StreetScore+ QOS to fall from QOS 2.7 to QOS 3; the pedestrian StreetScore+ QOS would remain at QOS 3.	Right-of-way acquisition would be required to accommodate the construction of a second westbound left-turn lane and a second receiving lane on the south leg. This mitigation measure may also be found in the Facebook Campus Expansion FEIR and the Menlo Gateway FEIR. The Town of Atherton has preliminary plans to redesign the intersection. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Quality of Service Findings The proposed mitigation would cause the bicycle StreetScore+ QOS to fall from QOS 2.7 to QOS 3; the pedestrian StreetScore+ QOS would remain at QOS 3.

Because this improvement depends on the actions of the City of Menlo Park and Town of Atherton, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Housing Alternative's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the proposed mitigation, a second receiving lane would be added on the southbound approach, causing an uncomfortable situation where bicyclists travel along a four-lane roadway compared to a three-lane roadway existing today. Missing sidewalks and curb ramps cause uncomfortable situations for pedestrians at all intersection crossings.

TABLE 5-3: CUMULATIVE (2035) WITH FULL OFFSET HOUSING ALTERNATIVE MITIGATION INTERSECTION LEVEL OF SERVICE, BICYCLE AND PEDESTRIAN QUALITY OF SERVICE RESULTS

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
5. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
6. Based on average pedestrian StreetScore+ Quality of Service of all intersection legs. See **Appendix H** for calculations.
7. Based on average bicycle StreetScore+ Quality of Service of all intersection legs. See **Appendix H** for calculations.
8. LTS = less-than-significant with mitigation, SU = significant and unavoidable. LTS/SU = less-than-significant with mitigation, but is either (1) located outside Santa Clara County where mitigation measures depend on funding and actions by other jurisdictions, or (2) located in Santa Clara County but depends on other funding for the mitigation to be constructed and thus the mitigation measure may not be implemented in a timely manner to avoid the impact. Significance determination is based on draft mitigation and responsible jurisdiction of the intersection.

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
5. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
6. Based on average pedestrian StreetScore+ Quality of Service of all intersection legs. See **Appendix H** for calculations.
7. Based on average bicycle StreetScore+ Quality of Service of all intersection legs. See **Appendix H** for calculations.
8. LTS = less-than-significant with mitigation, SU = significant and unavoidable. LTS/SU = less-than-significant with mitigation, but is either (1) located outside Santa Clara County where mitigation measures depend on funding and actions by other jurisdictions, or (2) located in Santa Clara County but depends on other funding for the mitigation to be constructed and thus the mitigation measure may not be implemented in a timely manner to avoid the impact. Significance determination is based on draft mitigation and responsible jurisdiction of the intersection.

5.2 FREEWAY SEGMENT IMPACTS AND MITIGATION MEASURES

Freeway impacts and the associated mitigation measures were evaluated under Background (2018) with Housing Alternatives and Cumulative (2035) with Housing Alternatives Conditions.

Each Housing Alternative is determined to cause a significant impact to freeway facilities based on the criteria described in Chapter 3 of TIA Part 2. Implementation of the each Housing Alternative would increase vehicle traffic and congestion, resulting in either unacceptable freeway segment LOS or increases in traffic volumes that would exceed the allowable percent increase threshold. This would be considered a significant impact on the following number of segments under each with Housing Alternative Condition:

- Background (2018) with Housing Alternatives Conditions– six segments (as compared to four segments under the Background (2018) with Project Conditions);
- Cumulative (2035) with Full Offset Alternative Conditions – sixteen segments (as compared to thirteen segments under Cumulative (2035) With Project Conditions); and
- Cumulative (2035) with Half Offset Alternative Conditions – thirteen segments (as compared to thirteen segments under Cumulative (2035) With Project Conditions).

There are limited options to widen the impacted freeway segments due to right-of-way constraints. Additionally, the widening of roadways can lead to other effects, such as induced travel demand (e.g., more vehicles on the roadway due to increased capacity on a particular route), air quality degradation, increases in noise associated with motor vehicles, and reductions in transit use (less congestion or reduced driving time may make driving more attractive than transit travel).

Mitigation of freeway impacts is considered beyond the scope of an individual development project, due to the inability of any individual project or local agency to:

1. Acquire right-of-way for freeway widening, Freeway improvements would require approval by VTA and Caltrans, and as such the local agency cannot guarantee implementation of any improvement in the freeway right-of-way.
2. Fully fund a major freeway mainline improvement. To provide adequate funding, additional sources would be needed, which may include State Transportation Improvement Program funds for projects identified in the VTP, local agency impact fees, and/or a future regional impact fee. The County of Santa Clara could potentially participate in development of a regional fee should it be proposed by regional agencies, such as VTA.

For these reasons, the Housing Alternatives' freeway impacts would remain **significant and unavoidable**.

5.3 NEIGHBORHOOD STREET IMPACTS

Similar to what was presented in TIA Part 2, two neighborhoods in Palo Alto (College Terrace and Crescent Park) were identified as locations where neighborhood traffic impacts might occur with the proposed growth in the 2018 General Use Permit. These locations were evaluated assuming the build-out of both Housing Alternatives for the following reasons:

- College Terrace – The neighborhood lies along the southern boundary of the campus and shares access with Stanford Avenue, which is a primary access route to the campus. Even though the traffic calming measures instituted in this neighborhood appear to have been effective, there remains a concern that there are routes through the neighborhood that drivers from Stanford might use to travel between Stanford Avenue and California Avenue to access Page Mill Road or El Camino Real.
- Crescent Park – The neighborhood lies along University Avenue which is a major access route to regional roadways such as US 101 and SR 84 (Dumbarton Bridge). There is existing congestion on the corridor that includes spillover traffic to parallel roadways such as Hamilton Avenue. Because some of the drivers accessing Stanford University travel along University Avenue, this neighborhood has been selected for further study.

5.3.1 TIRE INDICES ON LOCAL STREETS

Given that travel patterns throughout and surrounding the Stanford Campus may change with either Housing Alternative, a variation to the previous methodology was used to calculate the total number of daily trips that may divert through the two study neighborhoods.

Separate approaches were used to estimate the number of diverted daily trips for the College Terrace and Crescent Park neighborhoods. For the College Terrace neighborhood, a ratio was developed between the number of peak hour trips accessing the University via Bowdoin Street and the total number of daily trips under the 2018 General Use Permit conditions. This ratio was applied to the new number of peak hour trips using Bowdoin Avenue for each Housing Alternative to determine the new number of daily trips that would potentially cut through the College Terrace neighborhood. This method was also applied to vehicle trips along University Avenue to estimate the number of daily trips that would potentially cut through the Crescent Park neighborhood.

5.3.1.1 College Terrace TIRE Analysis

TIRE indices for the local streets serving Stanford University in the College Terrace neighborhood are presented in **Table 5-5**. The TIRE indices for existing volumes range from 2.6 to 3.1. Appendix N of TIA Part 2 shows the thresholds for the TIRE index relative to the number of vehicles per day.

Applying the ratio described above yields an estimate that 2,268 and 1,935 daily vehicles would use Bowdoin Street to access Stanford University for the Full Offset and Half Offset Housing Alternatives, respectively.

Many of the daily trips that access the Stanford campus at Bowdoin Street do not pass through the College Terrace neighborhood. There is a barrier at the entrance to the College Terrace neighborhood at Bowdoin Street. Accordingly, all vehicles entering or exiting the campus at Bowdoin Street must also use Stanford Avenue. Vehicles traveling to or from the campus via Stanford Avenue from west of Bowdoin Street do not pass through the College Terrace neighborhood. Vehicles traveling via Stanford Avenue from the east of Bowdoin Street can continue on Stanford Avenue directly to El Camino Real. These vehicles do not pass through the College Terrace neighborhood. The only vehicles that travel through the College Terrace neighborhood are those that zig zag through the neighborhood using College Avenue or California Avenue to and from El Camino Real, or by taking Hanover Street to or from Page Mill Road. Vehicles cannot travel directly from Stanford Avenue to Page Mill Road on Hanover Street. There is a barrier at the intersection of California Avenue and Hanover Street that prevents through traffic.

Figure 5-1 shows the total daily trips and percentage distributions of Stanford commuters for the College Terrace neighborhood. Morning and afternoon peak period turning movement counts (Appendix B of TIA Part 2) collected at the Bowdoin Street/Stanford Avenue intersection were used to estimate trip distribution along Stanford Avenue. For the Full Offset Housing Alternative, of the 2,268 additional daily trips accessing the campus at Bowdoin Street, it is estimated that 762 daily trips would travel on Stanford Avenue to the east of Bowdoin Street, thereby having the potential to pass through the College Terrace neighborhood. For the Half Offset Housing Alternative, of the 1,935 additional daily trips accessing the campus at Bowdoin Street, it is estimated that 650 daily trips would travel on Stanford Avenue to the east of Bowdoin Street.

Existing daily traffic volumes (Appendix O of TIA Part 2) collected throughout the College Terrace neighborhood where Stanford University traffic may use neighborhood streets were used to estimate trip distribution throughout College Terrace neighborhood. Due to the existing street closures and traffic calming devices, relatively few drivers are likely to choose to negotiate the circuitous route, as well as multiple stop signs and speed humps, to pass through the neighborhood to access El Camino Real given that Stanford Avenue is a direct route to El Camino Real with fewer stops. Similarly, it is unlikely that a large number of drivers would choose to travel from Stanford Avenue to Page Mill Road through the College Terrace neighborhood given that multiple turns would be needed and out of way travel. For example, if a driver were to leave the campus at Bowdoin Street, they would need to turn left on Stanford Avenue, right on Hanover Street, right College Avenue, left on Columbia Street and left on California Avenue to access Page Mill Road. The other options would be to use Stanford Avenue to access Peter Coutts to Junipero Serra Boulevard, or El Camino Real to access Page Mill Road.

Cornell Street, between College Avenue and California Avenue	2	370	2.6	97	33	No	39	No	33	No

Notes:

1. Minimum daily traffic volume increase to produce an impact.
2. Assumes 20% of the added daily Stanford traffic east of Bowdoin Street on Stanford Avenue.

Source: Fehr & Peers, April 2018.

While the traffic calming and circuitous routing minimizes the number of drivers electing to cut through the neighborhood, for the analysis it was assumed, based on professional judgment and knowledge of the neighborhood traffic calming and routing, that 20 percent of drivers who travel to and from the Stanford gateway via the east of Bowdoin Street might elect to pass through the neighborhood streets. Since the TIRE index is a daily calculation and the greatest time savings for drivers cutting through the neighborhood would be during the morning or evening peak periods when El Camino Real, Page Mill Road and Junipero Serra Boulevard are congested, the 20 percent assumption is considered conservative.

While it is unlikely that even 20 percent of the added daily Stanford traffic traveling east of Bowdoin Street on Stanford Avenue would travel through the neighborhood, this percentage was used to demonstrate a conservatively high scenario for the College Terrace neighborhood. Project trip estimates along Oberlin Street, Harvard Street, Hanover Street, Cornell Street, Princeton Street, and Columbia Street were distributed based on the relative existing daily volumes on these roadways. These values were compared to the volume changes needed to create a 0.1 TIRE index increase for each roadway to ascertain whether an impact would result under the Full Offset and Half Offset Housing Alternatives, as shown in **Table 5-5**.

5.3.1.2 Crescent Park TIRE Analysis

The TIRE indices for existing volumes in the Crescent Park neighborhood range from 3.5 to 3.7.

The percentage of trips using University Avenue that would be likely to divert to neighborhood roadways when passing through Downtown Palo Alto was calculated. The potential diversion of this volume to parallel routes within the Crescent Park neighborhood was based on an analysis of the relative existing daily traffic volumes (Appendix O of TIA Part 2) on University Avenue, Lytton Avenue, and Hamilton Avenue for four different segments: east of Middlefield Road, west of Lincoln Avenue, east of Lincoln Avenue, and west of Woodland Avenue. The existing daily traffic volumes along each roadway in each segment were used to estimate potential daily trip distributions. For example, if the Stanford 2018 General Use Permit is estimated to contribute 15 trips on University Avenue, while University Avenue has an existing 100 daily trips and Hamilton Avenue has an existing 50 trips, then 10 additional Stanford trips would be assumed to use University Avenue and five trips would be assumed to use Hamilton Avenue. The estimated potential daily trip distributions of new Housing Alternatives trips in Crescent Park neighborhood are shown in **Table 5-6** and **Figure 5-2**.

TABLE 5-6: CRESCENT PARK NEIGHBORHOOD TRIP DISTRIBUTION CALCULATIONS

Roadway Description		ADT	Percent of Total Volumes	Estimated Daily Trips		
				Proposed 2018 General Use Permit	Full Offset Housing Alternative	Half Offset Housing Alternative
Cordon 1	University Avenue E of Middlefield Road	20,640	71%	536	878	739

	Total for Cordon 4	***24,890***	***100%***	***757***	***1,241***	***1,044***

Source: Fehr & Peers, April 2018.

These values were compared to the volume changes needed to create a 0.1 TIRE index increase for each roadway to ascertain whether an impact would result under the Full Offset and Half Offset Housing Alternatives, as shown in **Table 5-7.**

5.3.2 RESULTS

The TIRE method is based on the premise that any traffic change that would cause an index increase of 0.1 or more would be noticeable to residents. As shown in **Table 5-5**: College Terrace Neighborhood TIRE Index Results and **Table 5-7**, the Housing Alternatives would not surpass the 0.1 change in TIRE index on any of the local residential street segments evaluated in the analysis of the Full Offset and Half Offset Housing Alternatives. This result is the same as the result of the analysis of the proposed 2018 General Use Permit.

Notes:

1. Minimum daily traffic volume increase to produce an impact.

Source: Fehr & Peers, April 2018.

5.4 TRANSIT, BICYCLE AND PEDESTRIAN IMPACTS

5.4.1 TRANSIT IMPACTS

Generally, a project causes a significant impact to transit facilities and services if an element of it conflicts with existing or planned transit services. The Housing Alternatives do not propose infrastructure changes outside the campus and, thus, would not interfere with transit agencies' ability to modify or expand service. Therefore, the Housing Alternatives' impact on transit services would be **less-than-significant**. In addition, as shown in Sections 3.3 and 4.3, while the Housing Alternatives would result in higher increased delays to transit routes compared to the proposed Project, these delays do not constitute substantial increases in delay for transit vehicles operating on surrounding roadways.

The intersection capacity mitigation measures discussed in Section 5.1.2 and 5.1.3 would add capacity to serve all vehicles, including transit vehicles, and would not obstruct any existing or planned transit route. Stanford's proposed mitigation approach for traffic impacts, discussed in Section 5.1.1, would reduce traffic growth relative to that analyzed in the traffic analysis, which would benefit all vehicular traffic including transit vehicles.

5.4.2 BICYCLE AND PEDESTRIAN IMPACTS

A significant impact to bicycle or pedestrian facilities occurs when a project creates a hazardous condition that currently does not exist for pedestrians or bicyclists, or conflicts with planned facilities or local agency policies regarding bicycle and pedestrian facilities. The Housing Alternatives do not propose any infrastructure changes outside the campus and, thus, would not create hazardous conditions where none exist today, nor conflict with planned facilities or County policies. Therefore, the Housing Alternatives' impact on pedestrian and bicycle facilities would be **less-than-significant**.

In addition, the intersection capacity mitigation measures discussed in Sections 5.1.2 and 5.1.3 would not adversely affect quality of service for pedestrians and bicyclists in all but two cases. Under both Cumulative (2035) Housing Alternative Conditions mitigation location, Middlefield Road/Marsh Road (Intersection #59), the bicycle quality of service would decrease from QOS 2.7 to QOS 3 (the same result as under the Cumulative (2035) with Project analysis).

Under the Cumulative (2035) with Full Offset Housing Alternative, the pedestrian quality of service would decrease from QOS 2 to QOS 2.5 at Middlefield Road/Charleston Road (Intersection #69). This is a new quality of service result for the Cumulative (2035) with Full Offset Housing Alternative Conditions that does not occur for the Cumulative (2035) with Project Conditions. The change in quality of service results from the proposed mitigation, which is the addition of a designated eastbound right-turn lane.

While the rest of the traffic mitigation measures do not change the quality of service index at the mitigation location, in some cases the mitigations do add another vehicle lane to cross or navigate as a bicyclist. However, these changes do not affect the QOS rating because it is already at 4 (the worst rating). In several cases, the mitigation measures may result in a slight improvement for bicyclists by removing a right-turn conflict zone due to re-striping. As noted in the traffic mitigation discussions, the implementation of the traffic mitigation measures would ultimately be the decision of the responsible jurisdiction, and considerations for bicyclist and pedestrian comfort and convenience may enter into those decisions, resulting in a modified improvement project that adds or enhances pedestrian and/or bicycle facilities, or rejection of the improvement project.

Separate from the above analysis, it is noted that the 2018 General Use Permit application describes several bicycle and pedestrian supportive projects that Stanford plans to construct on campus property that are designed to serve local area student trips to the Nixon and Escondido Elementary Schools. Stanford proposes to construct the improvements on its lands in unincorporated Santa Clara County that have been identified by the Palo Alto Unified School District (PAUSD) and the City of Palo Alto as the Suggested Routes to Schools shown on the Walkabout Maps for Nixon and Escondido Elementary Schools. These improvements would benefit both pedestrian and bicycle circulation in the immediate area of both schools. Circulation improvements on Stanford lands in unincorporated Santa Clara County, in and around Nixon Elementary School, could include such items as improved crosswalks with high-visibility yellow markings, pavement markings, additional signage, and wayfinding signs. Circulation improvements in and around Escondido Elementary School similarly could include such items as improved crosswalks with high-visibility yellow markings, pavement markings, additional signage, additional traffic control. Specific improvements on Stanford property could include an enhanced mid-block crosswalk on Escondido Road.

5.5 SAFETY AND EMERGENCY ACCESS IMPACTS

5.5.1 SAFETY IMPACTS

As described in Section 3.8.2 of TIA Part 2, the safety impacts of the 2018 General Use Permit are evaluated based on whether any identified intersection mitigation measure would cause an adverse safety effect for vehicles, transit, pedestrians, or bicyclists. This evaluation method applies to the Housing Alternatives as well. Housing Alternative mitigation measures would be constructed according to the relevant City or Caltrans design standards, which can be assumed to conform to industry standards for roadway and intersection design and operations. Therefore, the mitigation measures would not cause adverse safety effects for vehicles, transit, pedestrians or bicyclists, and the Housing Alternatives' impact on safety is **less-than-significant**.

5.5.2 EMERGENCY ACCESS IMPACTS

As described in Section 3.9.2 of TIA Part 2, the emergency access impacts of the 2018 General Use Permit are evaluated based on whether the Project would result in inadequate emergency access. This evaluation method applies to the Housing Alternatives as well. The Housing Alternatives do not propose any infrastructure changes outside the campus, and thus would not create barriers to or impede emergency access. The Housing Alternatives traffic analysis indicates significant impacts at intersections in both the Background (2018) and Cumulative (2035) Conditions, and identifies intersection capacity mitigations for some, but not all, of the impact locations. Emergency responders are charged with developing fastest-response travel routes and assessing traffic conditions and developing alternate routes in real time to provide emergency services. Therefore, the identified significant impacts would not result in inadequate emergency access within the traffic study area, and the impact on emergency access is **less-than-significant**.

APPENDIX A:
HOUSING ALTERNARTIVES TRIP GENERATION

FEHR PEERS

MEMORANDUM

Date: February 27, 2018

To: Lesley Lowe, Stanford University

From: Ellen Poling, Fehr & Peers

Subject: Responses to Commments on 2018 GUP Draft EIR: Housing Offset Alternatives Trip Generation and Distribution

SJ15-1585.00

This memorandum summarizes the trip generation estimates and trip distribution for two housing offset alternatives that the County of Santa Clara has chosen to study in response to comments of the 2018 General Use Permit Draft EIR:

- Full Offset Housing Alternative: 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds
- Half Offset Housing Alternative: 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds.

Trip Generation

The trip generation was estimated for both alternatives using:

- The Stanford resident peak hour trip generation rates in the *Stanford 2018 General Use Permit Transportation Impact Analysis*, and
- Stanford commuter peak hour trip generation rates that were developed in February 2017, to respond to peer review comments during the review process for *Stanford 2018 General Use Permit Transportation Impact Analysis: Part I.*

Both of these trip generation rates were previously peer-reviewed by the County's consultants, AECOM and ESA, in connection with preparation of the Draft EIR for the 2018 General Use Permit. The rates are presented in **Table 1**. It should be noted that the commuter trip generation rate is

the average rate per Stanford commuter, which accounts for the fact that only a portion of the commuters drive to campus. The residential rates are the measured trip generation rates on a per bed or per unit basis at Stanford student and faculty/staff housing sites. Residential rates include trips by Stanford affiliates as well as spouses and other houshold members.

Table 1: Trip Generation Rates

Trip Type	AM Peak Hour			PM Peak Hour Trips		
	In	Out	Total	In	Out	Total
Commuter (trips/Stanford affiliate living off campus)	0.096	0.041	0.137	0.051	0.084	0.135
Student Resident (trips/bed)	0.028	0.037	0.065	0.077	0.066	0.143
Faculty/Staff Resident (trips/unit)	0.150	0.280	0.430	0.260	0.190	0.450

Attachments 1 and **2** present the trip generation calculations for the Full Offset and Half Offset alternatives. **Table 2** summarizes the commute trips eliminated, residential trips added, and the net change, for each alternative.

Under the Full Offset Housing alternative, 2,342 new faculty/staff units are assumed to be constructed on the campus. We assume this would reduce the population that otherwise would commute to the campus by 2,342 individuals. Therefore, the trip generation estimation process starts by subtracting the commuters who would no longer commute to campus by multiplying 2,342 by the commuter trip generation rate and showing that result as a negative number. The trips associated with 2,342 new faculty/staff housing units are then added to that number to generate a net change in faculty/staff trips. The same process was used for the 210 graduate students who are assumed to be housed in new graduate student beds.

Under the Half Offset alternative, 1,171 new faculty/staff units are assumed to be constructed on the campus. We assume this would reduce the population that otherwise would commute to the campus by 1,171 individuals. Again, the trip generation estimation process starts by subtracting the commuters who would no longer commute to campus by multiplying 1,171 by the commuter trip generation rate and showing that result as a negative number. The trips associated with 1,171 new faculty/staff housing units are then added to that number to generate a net change in faculty/staff trips. The same process was used for the 105 graduate students who are assumed to be housed in new graduate student beds.

Table 2: Trip Generation Summary

Trip Type	AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total
Full Offset Alternative						
Commuter Trips Eliminated	(244)	(106)	(350)	(130)	(213)	(344)
Resident Trips Added	357	664	1,021	625	459	1,084
Net Change	113	558	671	495	246	740
Half Offset Alternative						
Commuter Trips Eliminated	(122)	(53)	(175)	(65)	(107)	(172)
Resident Trips Added	179	332	510	313	229	542
Net Change	56	279	335	247	123	370

The alternatives would generate a net increase in trips entering and leaving campus during the peak hours, due to the higher vehicle trip generating characteristics of faculty/staff residential units as compared to Stanford commuters. These trips would be in addition to those of the proposed project. The faculty/staff residential units could house singles, couples and families, generating the full range of housing-related trips by vehicle and other modes. These residential trips would have a different distribution than the commuter trips, as described below.

Trip Distribution

Figures 1 and **2** present the commuter and resident trip distribution patterns used in the *Stanford 2018 General Use Permit Transportation Impact Analysis*. The commuter distribution is based on Stanford off-campus resident locations, and the resident distribution is based on census data for the census tracts including the Stanford campus residential areas. A detailed description of the development of the trip distribution patterns is provided in the *Stanford 2018 General Use Permit Transportation Impact Analysis: Part I*. These distribution assumptions have been peer-reviewed by the County's consultants, AECOM and ESA. These distribution patterns will be used to distribute and assign the commuter trip reductions and residential bed/unit trip additions to the roadway network. The campus locations for the new residential units, listed below, will be reflected in the trip assignments.

Full Offset Alternative Development District Allocations

- 550 faculty/staff units in Quarry District
- 666 faculty/staff units in DAPER District
- 666 faculty/staff units in West Campus District
- 207 graduate student beds and 460 faculty/staff units in East Campus District

Half Offset Alternative Development District Allocations

- 550 faculty/staff units in Quarry District
- 242 faculty/staff units in DAPER District
- 242 faculty/staff units in West Campus District
- 104 graduate student beds and 137 faculty/staff units in East Campus District
