Notes:
Bold text indicates unacceptable operations (V/C ratio>1)
Bold and highlighted dicates a significant impact.
1. AM = morning peak hour, PM= evening peak hour
2. Existing lanes within Santa Clara County are from 2014 and are presented in the VTA *2014 Conformance and Monitoring Report* . Exsiting lanes within San Mateo County are from 2015 and a presented in the *C/CAG Level of Service and Performance Measure Monitoring Report 2015* .
3. The 2018 freeway network was obtained from VTA staff for use in the 2020 forecasting model and was assumed to be completed by 2018.
4. Freeway capacity is assumsed to be 2,200 vehicles per hour per lane (vphpl) for two lanes or less mixed-flow lanes and 2,300 vphpl for three or more mixed-flow lanes. HOV lanes are assumed to have a capacity of 1,650 vphpl.
5. V/C= volume-to-capcity ratio. Unacceptable operations occur when the V/C ratio is greater than 1.0.
6. If the Project causes a freeway segment to increase from a V/C ratio<1 to a V/C ratio>1 or contirbutes more than one percent of capacity on a freeweay segment already operating at a V/C ratio>1, then the Project is considered to have an impact.
*These segments are in San Mateo County. The C/CAG Final San Mateo Congestion Management Program-2011 (November,2011), reports the worst roadway segment operation. Mixed-flow and HOV lanes are reported together for CMP freeway segment monitoring for San Mateo County.

Notes:
Bold text indicates unacceptable operations (V/C ratio>1)
Bold and highlighted dicates a significant impact.
1. AM = morning peak hour, PM= evening peak hour
2. Existing lanes within Santa Clara County are from 2014 and are presented in the VTA *2014 Conformance and Monitoring Report* . Exsiting lanes within San Mateo County are from 2015 and a presented in the *C/CAG Level of Service and Performance Measure Monitoring Report 2015* .
3. The 2018 freeway network was obtained from VTA staff for use in the 2020 forecasting model and was assumed to be completed by 2018.
4. Freeway capacity is assumsed to be 2,200 vehicles per hour per lane (vphpl) for two lanes or less mixed-flow lanes and 2,300 vphpl for three or more mixed-flow lanes. HOV lanes are assumed to have a capacity of 1,650 vphpl.
5. V/C= volume-to-capcity ratio. Unacceptable operations occur when the V/C ratio is greater than 1.0.
6. If the Project causes a freeway segment to increase from a V/C ratio<1 to a V/C ratio>1 or contirbutes more than one percent of capacity on a freeweay segment already operating at a V/C ratio>1, then the Project is considered to have an impact.
*These segments are in San Mateo County. The C/CAG Final San Mateo Congestion Management Program-2011 (November,2011), reports the worst roadway segment operation. Mixed-flow and HOV lanes are reported together for CMP freeway segment monitoring for San Mateo County.

Notes:
Bold text indicates unacceptable operations (V/C ratio>1)
Bold and highlighted indicates a significant impact.
1. AM = morning peak hour, PM= evening peak hour
2. Existing lanes within Santa Clara County are from 2014 and are presented in the VTA *2014 Conformance and Monitoring Report* . Exsiting lanes within San Mateo County are from 2015 and a presented in the *C/CAG Level of Service and Performance Measure Monitoring Report 2015* .
3. The 2018 freeway network was obtained from VTA staff for use in the 2020 forecasting model and was assumed to be completed by 2018.
4. Freeway capacity is assumsed to be 2,200 vehicles per hour per lane (vphpl) for two lanes or less mixed-flow lanes and 2,300 vphpl for three or more mixed-flow lanes. HOV lanes are assumed to have a capacity of 1,650 vphpl.
5. V/C= volume-to-capcity ratio. Unacceptable operations occur when the V/C ratio is greater than 1.0.
6. If the Project causes a freeway segment to increase from a V/C ratio<1 to a V/C ratio>1 or contirbutes more than one percent of capacity on a freeweay segment already operating at a V/C ratio>1, then the Project is considered to have an impact.
*These segments are in San Mateo County. The C/CAG Final San Mateo Congestion Management Program-2011 (November,2011), reports the worst roadway segment operation. Mixed-flow and HOV lanes are reported together for CMP freeway segment monitoring for San Mateo County.

Notes:
Bold text indicates unacceptable operations (V/C ratio>1)
Bold and highlighted indicates a significant impact.
1. AM = morning peak hour, PM= evening peak hour
2. Existing lanes within Santa Clara County are from 2014 and are presented in the VTA *2014 Conformance and Monitoring Report* . Exsiting lanes within San Mateo County are from 2015 and a presented in the *C/CAG Level of Service and Performance Measure Monitoring Report 2015* .
3. The 2018 freeway network was obtained from VTA staff for use in the 2020 forecasting model and was assumed to be completed by 2018.
4. Freeway capacity is assumsed to be 2,200 vehicles per hour per lane (vphpl) for two lanes or less mixed-flow lanes and 2,300 vphpl for three or more mixed-flow lanes. HOV lanes are assumed to have a capacity of 1,650 vphpl.
5. V/C= volume-to-capcity ratio. Unacceptable operations occur when the V/C ratio is greater than 1.0.
6. If the Project causes a freeway segment to increase from a V/C ratio<1 to a V/C ratio>1 or contirbutes more than one percent of capacity on a freeweay segment already operating at a V/C ratio>1, then the Project is considered to have an impact.
*These segments are in San Mateo County. The C/CAG Final San Mateo Congestion Management Program-2011 (November,2011), reports the worst roadway segment operation. Mixed-flow and HOV lanes are reported together for CMP freeway segment monitoring for San Mateo County.

STREETSCORE+ CALCULATION SHEETS

2018 Project StreetScore+ Results

StreetScore+

Bike Score by Intersection

Intersection #2: I-280 NB Off-Ramp / Sand Hill Road

2018 with Project Conditions

Refer to StreetScore+ white paper for criteria definitions.

Bike StreetScore by Intersection	**West-Leg Approach**
	Input
View Basic Roadway Characteristics?	+
Roadway Name	I-280 NB Off-Ramp
at	Sand Hill Road
ADT (average daily traffic)	>15000
Prevailing Speed in MPH (use posted speed limit if speed data is not available)	50
Is there a raised median?	No
Number of Total Travel Lanes	3
What is the bicycle facility type?	Bicycle Route Or No Designated Bikeway
Is the intersection signalized?	Yes
Is there a right turn lane?	No
Segment LTS Score Per Mineta Methodology	**4**
Street Score+ LTS Score	**4**

StreetScore+

Bike Score by Intersection

Intersection #13: I-280 SB Ramps / Page Mill Road

2018 with Project Conditions

Refer to StreetScore+ white paper for criteria definitions.

Bike StreetScore by Intersection	**East-Leg Approach**	**West-Leg Approach**

Memorandum

To	ESA: Paul Mitchell	Pages	1
For	Santa Clara County: David Rader and Kavitha Kumar		
Subject	Peer Review of Stanford's 2018 General Use Permit (GUP) – Housing Alternatives SB 743 VMT Analysis		
From	AECOM: Nichole Seow and Greg Gleichman		
Date	May 10, 2018		

AECOM, as a member of the ESA team, is tasked with conducting a peer review of each transportation-related document submitted as part of the Stanford 2018 General Use Permit (GUP) application to verify that the documents follow generally-acceptable transportation planning practice, address the appropriate study area, and were conducted using methodologies that are clear and replicable.[1]

We have reviewed the 'Stanford 2018 General Use Permit: Housing Alternatives SB 743 VMT Analysis' by Fehr & Peers dated May 2018 and appreciate the corrections made. We have no further comments on the document.

[1] This language is from the scope of work in the AECOM contract for this project.

INTRODUCTION

This report presents the findings of an analysis of the Stanford 2018 General Use Permit (GUP) Housing Alternatives in terms of criteria proposed by the California Governor's Office of Planning and Research (OPR) to implement California State Law Senate Bill (SB) 743 (Steinberg, 2013). This is a supplemental report to the *Stanford 2018 General Use Permit: SB 743 VMT Analysis, August 2017*. The results presented in this report are based on the same methodology as described in the report prepared for the proposed Project. References to the pages where the methodologies are described are included.

A general discussion of SB743 along with the guidelines and technical advisories from the California Office of Planning and Research (OPR) that were used for calculating VMT are presented in the first two sections of the report prepared for the proposed Project (pages 1-10). In November 2017 OPR published a revised Technical Advisory on Evaluating Transportation Impacts in CEQA. The methodology used in the VMT report prepared for the proposed Project is consistent with the revised Technical Advisory.

DESCRIPTION OF HOUSING ALTERNATIVES

In response to comments on the Stanford 2018 General Use Permit EIR, the County of Santa Clara has chosen to study two Housing Alternatives that would increase the level of on-campus housing for students, faculty, staff and other workers compared to the proposed 2018 General Use Permit. The provision of additional on-campus housing would not increase student enrollment or change the number of employees compared to the population assumptions used for the proposed Project. The Housing Alternatives would include the same growth in academic square footage as the proposed Project. The Housing Alternatives also would include all of the housing that Stanford proposed to construct, plus additional campus housing. The following describes the changes in the housing supply for each alternative:

- Full Offset Housing Alternative: 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/ beds when combined with the 3,150 units/ beds that Stanford proposes to construct);
- Half Offset Housing Alternative: 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units/ beds when combined with the 3,150 units/ beds that Stanford proposes to construct).

The added on-campus housing would increase the total residential population of the campus. These changes will be described in the Population section of this report.

PROXIMITY TO TRANSIT

OPR proposes that lead agencies generally should presume that residential, retail, and office projects, as well as mixed-use projects that are a mix of these uses, proposed within 1/2 mile of an existing major transit

stop or an existing stop along a high quality transit corridor will have a less than significant transportation impact. A major transit stop is a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. A high quality transit corridor means a corridor with fixed route bus with service intervals no longer than 15 minutes during peak commute hours.

The SB 743 VMT Analysis prepared for the proposed Project demonstrated that the areas of the Stanford campus where development could occur under the 2018 General Use Permit are within 1/2 mile of an existing major transit stop or an existing stop along a high quality transit corridor. The Analysis concluded that the proposed 2018 General Use Permit can be presumed to result in a less-than-significant transportation impact. Nevertheless, because OPR had not finalized the proposed CEQA Guidelines and its recommendations could change, Fehr and Peers performed a quantitative assessment of VMT generated by the proposed 2018 General Use Permit.

The revised draft CEQA Guidelines circulated by OPR in November 2017 continue to state that projects located on sites within 1/2 mile of an existing major transit stop or an existing stop along a high quality transit corridor should be presumed to have a less-than-significant transportation impact. Nevertheless, this Housing Alternatives SB 743 VMT Analysis mirrors the Project analysis by including a quantitative assessment of VMT generated by the Housing Alternatives.

NUMERIC SIGNIFICANCE THRESHOLDS FOR 2018 GUP

As stated previously, the Housing Alternatives SB743 VMT calculation uses the same methodology as the VMT analysis for the proposed Project. A description of how the numeric significance thresholds were developed is contained in the Project report on pages 8-9. **Table 1** presents the VTA model estimates for the regional and Santa Clara County benchmarks.

TABLE 1: VMT BENCHMARKS

Traveler and Trip Type	Daily Average VMT per Capita	
	Santa Clara County	Bay Area
Worker Home-Based-Work VMT per Worker	N/A	16.18
Resident Home-Based VMT per Capita (Home-based Work + Home-based Other)	13.08	17.33

Source: 2015 VTA Travel Model

OPR's November 2017 Technical Advisory continues to recommend that regional, not city or county-level VMT averages should be used for judging impacts of employment-generating projects. The November 2017 Technical Advisory also continues to recommend that the benchmark for residential projects should be the higher of the county-level and regional averages. In this case, the regional average is higher and will represent the benchmark for residential VMT generation.

OPR's November 2017 Technical Advisory recommends setting thresholds of significance at 15 percent below the relevant benchmark. Taking all of these recommendations into account, **Table 2** indicates the VMT per capita generation thresholds to be applied to the proposed 2018 General Use Permit and Housing Alternatives. These thresholds were used to determine whether the 2018 General Use Permit would have significant VMT impacts.

TABLE 2: APPLICABLE BENCHMARKS AND NUMERIC SIGNIFICANCE THRESHOLDS

Traveler and Trip Type	Daily VMT per Capita	
	Benchmark (region-wide average)	**Numeric Threshold of Significance (85% of benchmark)**
Worker Home-Based-Work VMT per Worker	16.18	13.75
Resident Home-Based VMT per Capita	17.33	14.73

Source: Fehr & Peers, 2016

CAMPUS POPULATION

The typical weekday population on the Stanford campus is made up of students, faculty, staff, contractors and other onsite workers, visitors, and household members of students, faculty and staff residing on the campus. The provision of additional on-campus housing under the Full Offset and Half Offset Housing Alternatives would not increase student enrollment or change the total number of employees on the campus in 2035. The Housing Alternatives would reduce the number of commuters traveling to the campus compared to the proposed 2018 General Use Permit. However, there would be a substantial increase in campus residential population compared to the proposed Project.

Table 3 shows the changes in campus resident populations for the Full Offset and Half Offset Housing Alternatives compared to the proposed Project. The Full Offset Housing Alternative would increase the total campus resident population by 6,246 persons compared to the campus resident population anticipated under the 2018 General Use Permit. Of this population, 3,694 new residents would be spouses and other household members in the added housing. Overall, campus residents would increase by 32% compared to the proposed Project. The Half Offset Housing Alternative would increase the total campus resident

population by 3,126 persons. Of this population, 1,849 residents would be spouses and other household members in the added housing. Overall, campus residents would increase by 16% compared to the proposed Project.

The additional Stanford affiliates living on campus would no longer commute from off-campus so worker trip lengths would be shortened. The additional campus residents, including Stanford affiliates, spouses and other household members, would make trips to and from the campus for a variety of purposes, including work, school, recreation, shopping and entertainment. Campus resident populations under the 2018 General Use Permit, Full Offset Housing Alternative, and Half Offset Housing Alternative are presented in **Table 3**, below. The campus resident populations presented in Table 3 are limited to the study area defined by the SB 743 VMT Analysis prepared for the proposed Project.

TABLE 3: CAMPUS RESIDENT POPULATIONS

Alternative	Total Residents	Stanford Affiliates	Spouses & Other Household Members
Fall 2015 Existing Conditions	12,592	11,468	1,124
Fall 2018 Baseline	13,028	11,888	1,140
2018 General Use Permit (Project)	19,353	17,116	2,237
Full Offset Housing Alternative	25,599	19,668	5,931
Change from 2018 GUP	6,246	2,552	3,694
	32.3%	15%	165%
Half Offset Housing Alternative	22,479	18,393	4,086
Change from 2018 GUP	3,126	1,277	1,849
	16.2%	7%	83%

Source: Fehr & Peers, 2018

FALL 2035 VMT GENERATION - FULL OFFSET HOUSING ALTERNATIVE

Using the methodology described in the *Stanford 2018 General Use Permit: SB 743 VMT Analysis, August 2017*, report, estimates of worker and resident VMT for Fall 2035 were prepared for the Full Offset Housing Alternative using the following assumptions. Between Fall 2018 to Fall 2035, the campus is anticipated to add 6,288 employees and contractors with an increase in enrollment of 2,900 students[1]. In 2035, the General Use Permit study area would include 29,915 employees and contractors and an enrollment of 19,513 students. The worker population including employees, contractors and students would be 49,428. These

[1] *Stanford General Use Permit SB743 VMT Analysis, August 2017*, Table 3, page 18.

are the same growth assumptions used in the 2035 VMT analysis for the proposed Project.

However, under the Full Offset Housing Alternative the campus resident population within the study area would increase by 12,571 persons including Stanford affiliates, spouses and other household members between Fall 2018 and Fall 2035. This represents an increase in resident population of 6,246 persons over the proposed Project.

In addition to an increase in the campus residents, the additional housing would create the need for more construction workers on the campus. For the Full Offset Alternative it was assumed that, on average an additional 50 construction workers would be on campus on a typical day.

The resulting Fall 2035 VMT for campus workers and residents is indicated in the **Table 4**. The detailed calculations are documented in **Appendix A.** The Full Offset Housing Alternative home-based work VMT per worker, and home-based VMT per resident would be below the SB 743 thresholds, allowing a determination of less-than-significant impacts for the Full Offset Housing Alternative.

TABLE 4: FALL 2035 TYPICAL WEEKDAY VMT – FULL OFFSET HOUSING ALTERNATIVE

Traveler	Trip Purposes	Population	VMT	VMT per Person*	SB 743 Threshold VMT per Person
Workers (Including Students)	HBW	49,479	208,483	4.21	13.75
Residents	HBW + HBO	25,599	316,926	12.38	14.73

* - Worker HBW trips were adjusted by +2% and Resident HB trips were adjusted by +3% to reflect changes in trip length derived from the VTA model.
Source: Fehr & Peers, 2018

FALL 2035 VMT GENERATION - HALF OFFSET HOUSING ALTERNATIVE

Using the methodology described in the *Stanford 2018 General Use Permit: SB 743 VMT Analysis, August 2017*, report, estimates of worker and resident VMT for Fall 2035 were prepared for the Half Offset Housing Alternative using the following assumptions. By 2035, the campus is anticipated to add 6,288 employees and contractors with an increase in enrollment of 2,900 students. In 2035, the General Use Permit study area would include 29,915 employees and contractors and an enrollment of 19,513 students. The worker population including employees, contractors and students would be 49,428. These are the same growth assumptions used in the 2035 VMT analysis for the proposed Project.

However, under the Half Offset Housing Alternative the campus resident population within the study area would increase by 9,451 persons including Stanford affiliates, spouses and other household members between Fall 2018 and Fall 2035. This represents an increase in resident population of 3,126 persons over the proposed Project.

In addition to an increase in the campus residents, the additional housing would create the need for more construction workers on the campus. For the Half Offset Alternative it was assumed that, on average an additional 23 construction workers would be on campus on a typical day.

The resulting Fall 2035 VMT for campus workers and residents is indicated in the **Table 5**. The detailed calculations are documented in **Appendix B.** The Half Offset Housing Alternative home-based work VMT per worker, and home-based VMT per resident would be below the SB 743 thresholds, allowing a determination of less-than-significant impacts for the Half Offset Housing Alternative.

TABLE 5: FALL 2035 TYPICAL WEEKDAY VMT – HALF OFFSET HOUSING ALTERNATIVE

Traveler	Trip Purposes	Population	VMT	VMT per Person*	SB 743 Threshold VMT per Person
Workers (Including Students)	HBW	49,451	216,134	4.37	13.75
Residents	HBW + HBO	22,479	262,899	11.70	14.73

* - Worker HBW trips were adjusted by +2% and Resident HB trips were adjusted by +3% to reflect changes in trip length derived from the VTA model.

HOUSING ALTERNATIVES VMT COMPARISON AND CONCLUSIONS

Worker VMT

Table 6 summarizes the SB 743 VMT calculations for the 2018 General Use Permit and the two Housing Alternatives. SB 743 calculations focus on average daily trips by Stanford-affiliated workers between their homes and the Stanford campus, and average daily trips by Stanford campus residents to all destinations. SB 743 VMT calculations are expressed as VMT per worker and VMT per resident. Adding on-campus housing would reduce the average daily VMT per worker by 7.0% under the Full Offset Housing Alternative and by 3.5% under the Half Offset Housing Alternative, as compared to the proposed Project. These reductions represent fewer trips by Stanford affiliates traveling to and from the campus for work and shorter trip lengths for those Stanford workers living on campus.

TABLE 6: COMPARISON OF HOUSING ALTERNATIVES SB743 VMT

	Worker w/ Student		Residents	
Scenario	**VMT**	**VMT/worker**	**VMT**	**VMT/resident**
2018 General Use Permit	223,842	4.53	207,986	10.75
Full Offset Alternative	208,483	4.21	316,926	12.38
Change from 2018 GUP	-15,359	-0.32	108,940	1.63
	-6.9%	-7.0%	52%	15%
Half Offset Alternative	216,134	4.37	262,899	11.70
Change from 2018 GUP	-7,708	-0.16	54,913	0.95
	-3.4%	-3.5%	26%	9%

Source: Fehr & Peers, 2018

Resident VMT

The addition of on-campus housing would increase the average daily VMT per resident by 15% under the Full Offset Housing Alternative and by 9% under the Half Offset Housing Alternative, as compared to the proposed Project. Campus residents include Stanford affiliates, spouses and other household members living in the campus housing units. The daily VMT of residents is for all trip types including work, shopping, recreational, school (K-12), etc. The increase in VMT per resident would be due to the change in the on-campus proportion of faculty/staff housing units as compared to student beds. Faculty/staff units generate higher VMT per resident than student beds.

ANNUAL VMT CALCULATIONS FOR GREEN HOUSE GAS EMISSIONS ANALYSIS

Table 7 summarizes the annual VMT calculations for both of the Housing Alternatives. Under the Full Offset Housing Alternative the total annual VMT would increase by over 34 million miles per year (a 17.8% increase) compared to the proposed Project. Under the Half Offset Housing Alternative the total annual VMT would increase by over 17 million miles per year (a 9.0% increase) compared to the proposed Project.

These annual VMT calculations are used as inputs into the greenhouse gas analyses for the Housing Alternatives.

* University Terrace is located very close to the campus in the area bounded by Page Mill Road, California Avenue and Hanover Street.
** The Faculty Subdivision is housing areas adjacent to the campus, outside the GUP study area. The area is bounded by Junipero Serra Blvd, Page Mill Road, Bowdoin Avenue, and Mayfield Road

Column C	Workers & Students provided by Stanford Land Use Environmental Planning (LUEP) / Institutional Research & Decision Support (IRDS)
Column D	Population equals workers or student except for Non-Matriculating Students whose trips are treated as visitors. Residential tables add family members.
Column E	P&TS Annual Survey (2015) commute frequency adjustment for how often workers come to campus
Column F	P&TS Annual Survey (2015) vehicle mode split including drive alone, carpool, and vanpool For non Stanford workers (third party, janitorial and construction) mode split from Census Fact Finder 2014 Journey to Work data Santa Clara County workers
Column G	P&TS Annual Survey (2015) vehicle occupancy drive alone = 1, carpool = 2 and vanpool = 5
Column H	Calculation = Population * Commute Frequenct * Vehicle Mode Split / Vehicle Occupancy * 2
Column I	Average one-way trip length ror campus workers and off campus students, calculated by P&TS from place of residence and survey mode choice data For non Stanford workers (third party, janitorial and construction) HBW trip length from the Santa Clara Valley Transportation Authority (VTA) 2015 model checked against California Household Transportation Survey (CHTS) 2012 for Santa Clara County workers
Column J	Calculation = Daily Vehicle Trips x Trip Length
Column K	Calculation total VMT / total population
Column L	Work day estimated by P&TS adjusting for weekends, holidays and standard PTO for Stanford Students estiamted by P&TS based on academic schedule for Grad and Undergrads
Columns M, N, & O	Calculations daily VT & VMT times number of days per year and VMT divided by population

Journey to work, FactFinders, 2014	**Mode**	%
	Drive Alone	76.5%
	2-person	8.2%
	3-person	1.4%
	4+ person	0.8%
	Total	86.9%
	Persns/Veh	1.07

F/S Week daysper year 251 — 52 Weekends / 10 Holiday days per year — 114

Graduate Week days per year 208 — 52 Weekends / 10 Holiday days per year — 114

UG Week days per year 150 — 30 Weekends / No Holiday days per year — 60

Post Doc Week daysper year 251 Same as F/S — 52 Weekends / 10 Holiday days per year — 114

Columns B through I Carried over from Residential VMT Daily Calculation

Column F is not carried over to avoid double counting affiliate HBW trips.

Column J Calculated annual week day VMT using week days shown below calculations

Columns K, L, M, N Weekend trip generation was assumed to be equal to daily based on ITE Trip Generation data.

ITE shows that Saturday trip generation is 5 - 9 percent higher and Sunday is 8 percent lower.

Assumed that all trips are HBO trips.

Used same internal to external relationship for weekend trips.

ITE Trips Rates			Saturday		Sunday		Averaged
Single Family Housing - Faculty	D.U.	9.57	10.08	105%	8.77	92%	98%
Condo/Townhouse - Faculty	D.U.	6.59	7.16	109%	6.07	92%	100%
Graduate Apartments - Low Rise	D.U.	6.59	7.16	109%	6.07	92%	100%

Columns O, P, Q Weekend trip lengths from California Household Transportation Suvey 2012 data for Palo Alto

Column R Calculated average weekend daily VMT = trips x trip length

Column S Calculated annual weekend VMT using weekend daily VMT and weekend/holiday days shown

Column T Total Daily Vehicle Trips = Column I + Column R

Column U Total Daily Vehicle Miles Traveled = Column J + Column S

Workers	People	VMT	People	VMT	People	VMT	
Worker Commute - all employee types including all resident F/S	29,938	306,262					Worker Student - D29 & J29
Student Commute to Campus (live off campus)	2,908	16,259	2,908	16,259			Worker Student - D31+D34, & J36
Resident Students - Grad / Undergrad	16,605	0	16,605	0			Worker Student - D37+D38, & J39
Residents							
Commute Trips - Off Campus						(HBW)	
Faculty / Staff (including other household members)					3,945	15,789	Resident Daily - C8 & T8+U8
Graduate Students (including other household members)					9,611	8,355	Resident Daily - C9 & T9+U9
Undergrad Students					8,317	0	Resident Daily - C10 & T10+U10
Post Doctoral Students					606	2,605	Resident Daily - C11 & T11+U11
Home-based Other						(HBO)	
Faculty / Staff (including other household members)					Same	50,960	Resident Daily - V8 + W8
Graduate Students (including other household members)					as	124,826	Resident Daily - V9 + W9
Undergrad Students					above	44,567	Resident Daily - V10 + W10
Post Doctoral (including other household members)						8,399	Resident Daily - V11 + W11
Totals	**49,451**	**322,521**	**19,513**	**16,259**	**22,479**	**255,501**	
2035 Trip Length Adjustment based on VTA Model (2% HBW* / 3% HBO)		**328,971**		**16,584**		**262,899**	

VMT / Person - Workers Including Students	Absentee	HBW	**VMT****	**VMT*****	**VMT*****
non-students only (HBW trips)	90%	73%	216,134		
			4.37	0.85	11.70
Threshold - 85% of the VTA Model Regional VMT			13.75		14.73
VMT / Person - Workers Excluding Students	Absentee	HBW	**VMT***		
Adjustments for comparison to model HBW VMT	90%	73%	205,238		
			6.86		

* The 2% growth factor was applied to all Home-Based Work trips including HBW trips on campus. This is a conservative approach for campus trips.

** For the comparison to the VTA model threshold, the manual calculation is reduced to reflect that HBW trips are only 73% of trips at the work place and by 10% for daily absenteeism.

*** No adjustments required for Student or Resident VMT since the calculated and model results are directly comparable.

* University Terrace is located very close to the campus in the area bounded by Page Mill Road, California Avenue and Hanover Street.
** The Faculty Subdivision is housing areas adjacent to the campus, outside the GUP study area. The area is bounded by Junipero Serra Blvd, Page Mill Road, Bowdoin Avenue, and Mayfield Road

Column C Workers & Students provided by Stanford Land Use Environmental Planning (LUEP) / Institutional Research & Decision Support (IRDS)

Column D Population equals workers or student except for Non-Matriculating Students whose trips are treated as visitors. Residential tables add family members.

Column E P&TS Annual Survey (2015) commute frequency adjustment for how often workers come to campus

Column F P&TS Annual Survey (2015) vehicle mode split including drive alone, carpool, and vanpool

For non Stanford workers (third party, janitorial and construction) mode split from Census Fact Finder 2014 Journey to Work data Santa Clara County workers

Column G P&TS Annual Survey (2015) vehicle occupancy drive alone = 1, carpool = 2 and vanpool = 5

Column H Calculation = Population * Commute Frequenct * Vehicle Mode Split / Vehicle Occupancy * 2

Column I Average one-way trip length ror campus workers and off campus students, calculated by P&TS from place of residence and survey mode choice data
For non Stanford workers (third party, janitorial and construction) HBW trip length from the Santa Clara Valley Transportation Authority (VTA) 2015 model checked against California Household Transportation Survey (CHTS) 2012 for Santa Clara County workers

Column J Calculation = Daily Vehicle Trips x Trip Length

Column K Calculation total VMT / total population

Column L Work day estimated by P&TS adjusting for weekends, holidays and standard PTO for Stanford

Students estiamted by P&TS based on academic schedule for Grad and Undergrads

Columns M, N, & O Calculations daily VT & VMT times number of days per year and VMT divided by population

Journey to work, FactFinders, 2014	**Mode**	%
	Drive Alone	76.5%
	2-person	8.2%
	3-person	1.4%
	4+ person	0.8%
	Total	86.9%
	Persns/Veh	1.07

memorandum

date	March 28, 2018
to	David Rader, Senior Planner Santa Clara County Department of Planning and Development
from	Brian Boxer, Paul Mitchell, Jennifer Brown - ESA
subject	**ESA Peer Review of Stanford University 2018 General Use Permit EIR: Wastewater for Housing Alternatives**

In support of the 2018 General Use Permit EIR additional housing alternatives, Stanford prepared and submitted the *2018 General Use Permit EIR: Wastewater for Housing Alternatives* memo, prepared on March 16, 2018.

At the request of the County, ESA conducted an independent peer review of this report to verify the technical accuracy of the information, and identify any apparent deficiencies, errors and omissions affecting the completeness, methodologies, findings and adequacies of the report. The ultimate goal of the peer review is to help ensure that the information contained in the report met accepted professional standards for use in the EIR.

As part of the peer review, ESA advised County staff of any revisions or additions to the memo that were necessary. ESA prepared and submitted a technical peer review memoranda to the County documenting its comments. In turn, Stanford prepared a response memoranda indicating how ESA peer review comments were responded to; and updated the memo accordingly. The memo was revised by Stanford on March 28 2018. In general, revisions to the memo made in response to peer review comments and Stanford staff-initiated changes include miscellaneous minor numerical and editorial adjustments.

Based on the peer review conducted; ESA concludes that this *2018 General Use Permit EIR: Wastewater for Housing Alternatives* memo is appropriate for use as reference in the EIR.

memorandum

date March 28, 2018

to Steve Piasecki, County of Santa Clara

cc Brian Boxer, ESA; Paul Mitchell, ESA

from Catherine Palter, Stanford University

subject 2018 General Use Permit EIR: Wastewater for Housing Alternatives *Revised*

This technical report presents estimates for wastewater resulting from each of the two housing alternatives that the County has elected to study in response to Draft EIR comments.

The technical data in this memo follow the methodologies established in the 2018 General Use Permit application (November 21, 2016) and the corresponding Draft Environmental Impact Report prepared by the County and its consultant (October 2017).

Housing Alternative Descriptions
The two housing offset alternatives that the County of Santa Clara has chosen to study in response to comments on the 2018 General Use Permit Draft EIR would provide housing within the Academic Growth Boundary at the following levels:

- Full Offset Housing Alternative: Adds to the proposed project 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- Half Offset Housing Alternative: Adds to the proposed project 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

Wastewater Collection
Stanford's wastewater is collected in its sanitary sewer system and conveyed to and through Palo Alto sewer lines to the City of Palo Alto owned and operated Harold L. May Regional Wastewater Quality Control Plant (RWQCP), at the north side of the city, where it is treated prior to discharge into the San Francisco Bay. The campus sanitary sewer system consists of 43 miles of pipe and is owned and managed by Stanford.

The RWQCP is funded by and serves six partners: Palo Alto, Stanford, Mountain View, East Palo Alto Sanitary District, Los Altos, and Los Altos Hills. Approximately 220,000 people live in the RWQCP service area. Of the wastewater flow to the RWQCP, about 60 percent is estimated to come from residences, 10 percent from

industries, and 30 percent from commercial businesses and institutions.[1] The RWQCP treated 21 million gallons per day (mgd) of effluent from all the partner agencies before the drought (2012-2013), and just under 18 mgd in the July 2015-June 2016 plant fiscal year.[2]

Existing Capacity

The RWQCP is designed to have an average dry weather flow (ADWF) capacity of 39 mgd and an average wet weather flow capacity of 80 mgd.[3] According to the City of Palo Alto, the RWQCP does not experience any major treatment system constraints and capacity is sufficient for current dry and wet weather loads and for future load projections.

In 2012, Palo Alto adopted the Long Range Facilities Plan which outlined capital reinvestment, wastewater treatment services for the six partners, and ongoing water quality control to protect the San Francisco Bay and local creeks.

The City of Palo Alto, serving as the Discharger, has an approved pretreatment program, which includes approved local limits as required by the NPDES permit. The permit requires the Discharger to evaluate its local limits, such as those established by the other entities contributing to the RWQCP, to ensure compliance with updated effluent limits. The RWQCP is required to monitor the permitted discharges into the collection system in order to evaluate compliance with the RWQCP's permit conditions.

Stanford Existing Discharge

The City of Palo Alto reports that Stanford's current average daily sewer discharge is 1.1 mgd, which represents approximately 2.8 percent of the plant's total average dry weather flow capacity.[4] Stanford owns capacity in the plant of up to 2.11 mgd average dry weather flow, which is 5.26 percent of the plant's capacity. Actual metered sanitary sewer flows between 2010 and 2016 at Stanford range from approximately 0.5 mgd to 1.6 mgd, as flows vary based on activities, and whether students are on campus. The campus has separate sanitary sewer and stormwater systems. Therefore, any elevation in sanitary sewer flow during wet weather days are related to infiltration and inflow and not intentionally conveyed storm drainage flows.

Wastewater Use under the Housing Alternatives

In the Draft EIR, wastewater demand was estimated for the proposed project as follows:

- Existing wastewater demand of 1.1 mgd
- Increase due to 2018 General Use Permit of 0.4 mgd (conservatively assumed to be the same as the increase in water demand)
- Increase due to remaining development under the 2000 General Use Permit of 0.2 mgd
- Total wastewater demand in 2035 of 1.7 mgd

[1] City of Palo Alto, Draft Existing Conditions Report, Comprehensive Plan Update, Utilities and Services Systems. August 2014.
[2] Ibid.
[3] City of Palo Alto, Draft Existing Conditions Report, Comprehensive Plan Update, Utilities and Services Systems. August 2014.
[4] Palo Alto Regional Water Quality Control Plant, Fourth Quarter Partners Share Estimate Spreadsheet, Fiscal Years 2012-2013 and 2015-2016.

The total incremental potable water demand of the housing alternatives (compared to proposed project conditions) is estimated [5] as:

- Full Offset Housing Alternative = 0.54 mgd
- Half Offset Housing Alternative = 0.27 mgd.

Option 1. Wastewater Demand using Draft EIR assumptions

Using the conservative assumption used in the Draft EIR that 100 percent of the net increase in indoor domestic water demand becomes wastewater, the estimated total wastewater generation rate at buildout of the Full Offset Housing Alternative and Half Offset Housing Alternative would be approximately 2.24 mgd (1.7 + 0.54) and 1.97 mgd (1.7 + 0.27) respectively. The Full Offset Housing Alternative would exceed Stanford's current allocation in the wastewater treatment plant of 2.11 mgd. The Half Offset Housing Alternative would not exceed Stanford's current wastewater allocation.

Option 2. Wastewater Demand using historic demand assumptions

Historic wastewater metering data show that Stanford's average annual wastewater demand is approximately 70 percent of Stanford's average annual domestic water use, due to water use that does not enter the wastewater stream (see Attachment A). Applying that percentage to the anticipated water demand of the housing alternatives, the Full Offset and Half Offset housing alternatives would result in a total demand of 2.09 and 1.90 mgd, respectively. Both Housing Alternatives would not exceed Stanford's current allocation in the wastewater treatment plant of 2.11 mgd.

Conveyance

Stanford sanitary sewer flow discharges to the City of Palo Alto main that runs parallel to El Camino Real. This main is 21 inches in diameter and has a calculated maximum flow capacity of approximately 4,370 gallons per minute (gpm). Current measured daily dry weather peak flows are approximately between 1,000-1,700 gpm dependent on the time of year.[6] The potential increase in peak flow under the 2018 General Use Permit and Housing Alternatives would not result in the need to upsize the City of Palo Alto main.

[5] Water Supply Assessment for the Stanford 2018 General Use Permit EIR Analysis of Housing Alternative by Schaaf & Wheeler, dated March 16, 2018.

[6] Stanford University Water Resources and Civil Infrastructure Group Records. April 2017.

ATTACHMENT A

Table A-1 provides historic annual average data for Stanford's wastewater demand, domestic water demand, and the percentage of wastewater use compared to domestic water use. Between 2000 and 2014, before the new Central Energy Facility was constructed, wastewater demand was approximately 56 percent of domestic water demand. In 2015, once the new Central Energy Facility reduced the consumption of water in energy production, wastewater demand increased to approximately 69 percent of domestic water demand. The percentage increased to 81 percent in 2016, but this was an extreme drought year when domestic water demand dropped to an unusual level. Therefore, future wastewater demand will be predicted as 70 percent of future domestic water demand.

Table A-1: Annual Wastewater and Domestic Water Use

MEMORANDUM

TO:	Lesley Lowe, Stanford University, Land Use and Environmental Planning	DATE:	March 26, 2018
FROM:	Andrew Sterbenz, PE	JOB#:	STAN.10.15
SUBJECT:	Water Supply Assessment for the Stanford 2018 General Use Permit EIR Analysis of Housing Alternatives		

Schaaf & Wheeler prepared the Water Supply Assessment for the Stanford 2018 General Use Permit, dated April 2017, for peer review by Santa Clara County and inclusion in the Draft Environmental Impact Report (EIR) for the Stanford 2018 General Use Permit Update (the Proposed Project). In response to comments received on the Draft EIR, Santa Clara County has chosen to study two housing offset alternatives:

- Full Offset Housing Alternative: 2,549 additional units/beds, including 2,342 faculty/staff units and 207 graduate student beds (for a total of 5,699 net new housing units/beds when combined with the 3,150 units/beds that Stanford proposes to construct);
- Half Offset Housing Alternative: 1,275 additional units/beds, including 1,171 faculty/staff units and 104 graduate student beds (for a total of 4,425 net new housing units when combined with the 3,150 units/beds that Stanford proposes to construct).

The purpose of this memorandum is to provide supplemental water demand analysis of these alternatives, and the revised Water Supply Assessment (WSA) results and summary tables for each alternative. This analysis uses the same methodology and demand factors as in our report for the Proposed Project. The analysis used to determine the number of student beds and faculty/staff units under each scenario was prepared by Stanford University[1].

The housing offset alternatives increase the number of student beds and faculty/staff dwelling units, as summarized in Values for unchanged items are carried forward from the 2017 WSA report without discussion in this memorandum. Although it is possible that additional housing units constructed under these alternatives may replace some existing irrigated landscaping, for this analysis we assume there is no change in irrigation demand from the analysis for the Proposed Project.

Table 1 (below). The following elements from the WSA for the Proposed Project are unchanged:

- Planned additional academic and childcare facilities
- Energy system cooling water demands
- Landscape irrigation demands
- Available water supply from existing surface water rights, groundwater wells and the SFPUC

Values for unchanged items are carried forward from the 2017 WSA report without discussion in this memorandum. Although it is possible that additional housing units constructed under these alternatives

[1] Memorandum: 2018 General Use Permit EIR: Housing Alternative Description *Revised*, dated March 12, 2018

may replace some existing irrigated landscaping, for this analysis we assume there is no change in irrigation demand from the analysis for the Proposed Project.

Table 1, Comparison of Housing Alternatives

	2018 General Use Permit			Full Offset Housing Alternative		Half Offset Housing Alternative	
Water use category	Existing by 2020	2018 GUP Adds	Total in 2035	Adds to 2018 GUP	Total in 2035	Adds to 2018 GUP	Total in 2035
Student housing (beds)	14,318	2,600	16,918	207	17,125	104	17,022
Faculty/staff housing (units)	937	550	1,487	2,342	3,829	1,171	2,658
TOTAL	**15,255**	**3,150**	**18,405**	**2,549**	**20,954**	**1,275**	**19,680**

Full Offset Housing Alternative

The Full Offset Housing Alternative would add 2,549 additional units/beds to those proposed in the 2018 General Use Permit. The 2018 General Use Permit included the addition of 550 faculty/staff units to the campus and this alternative would add 2,342 more, for a total increase of 2,892 new units and a campus total at buildout of 3,829 faculty/staff dwelling units. The 2018 General Use Permit included the addition of 2,600 student beds and this alternative would add 207 more graduate student beds, for a total increase of 2,807 beds and a campus total at buildout of 17,125 student beds. The resulting totals for the Full Offset Housing Alternative are reflected in Table 2, below.

Table 2, Summary of Existing and Proposed Development for Full Offset Housing Alternative[2]

Water use category	Unit of Measure	Existing development in 2012	Completed development 2012-2015	Projected development 2015-2018	Projected development 2018-2020	2018 GUP development 2018-2035	Full Offset Housing Alternative	Total at Buildout Fall 2035
Academic and Childcare	sq. ft.	9,104,902	412,603	769,354	0	2,315,000	0	12,601,859
Student housing	beds	11,323	559	416	2,020	2,600	207	17,125
Faculty/staff housing	dwelling units	937	0	0	0	550	2,342	3,829

The existing and projected future potable water demands for the campus are provided in Table 3, below. Total campus water demand, including non-potable irrigation, is provided in Table 4.

[2] This table revises values presented in Table 2-1 of the 2017 WSA.

Table 3, Summary of Existing and Projected Potable Water Demand for Full Offset Housing Alternative[3]

Water use category	Unit of Measure	Existing development in 2012	Water Use FY2012-13 mgd	Water Use factor gal/day/unit	Buildout total Fall 2035	Water Use at Buildout, mgd
Academic and Childcare	sq. ft.	9,104,902	0.66	0.072	12,601,859	0.91
Student housing	beds	11,323	0.46	40.6	17,125	0.70
Faculty/staff housing	dwelling units	937	0.52	555	3,829	1.17 **
Energy Systems			0.46	NA		0.20
TOTAL			**2.10**			**2.98**

** As in the 2017 WSA for the Proposed Project, future FSH usage is based on a projected water consumption rate of 225 gal/day/unit for new FSH units, which will be more urban in nature than the existing FSH units. 225 gal/day/unit is based on current usage data for comparable existing units (Olmsted Terrace, Pearce Mitchell, Peter Courts)

Table 4, Projected Total Water Demands, 2020-2035 (mgd) for Full Offset Housing Alternative[4]

Water Use Category	FY2012-13 Actual	FY2015-16 Actual	2020 Projected	2025 Projected	2030 Projected	2035 Projected
Academic	0.66	0.47	0.74	0.80	0.86	0.91
Student housing	0.46	0.42	0.53	0.59	0.64	0.70

Energy Systems	0.46	0.18	0.17	0.18	0.19	0.20
TOTAL POTABLE	**2.10**	**1.39**	**2.17**	**2.44**	**2.71**	**2.98**
Landscape (Non-Potable)	1.23	0.81	1.27	1.29	1.32	1.35
TOTAL	**3.33**	**2.20**	**3.44**	**3.73**	**4.03**	**4.33**

In the 2017 WSA for the Proposed Project, the projected total water demand in 2035 was 2.44 mgd (potable) and 3.79 mgd (total). Compared to the Proposed Project, this alternative increases potable and total water demand by 0.54 mgd. The campus receives water supply as a wholesale customer of the San Francisco Public Utilities Commission (SFPUC), from surface water rights and groundwater wells. Currently, only the SFPUC supply is used to meet potable demands. Demands and supply projections are summarized in Table 5, below. The projected potable demand under this alternative is almost equal to the SFPUC contract amount (Individual Supply Guarantee of 3.03 mgd).

[3] This table revises values presented in Table 2-2 of the 2017 WSA.
[4] This table revises values presented in Table 2-4 of the 2017 WSA.

Table 5, Summary of Projected Demands and Projected Supply (mgd) for Full Offset Housing Alternative [5]

Water use category		FY2012-13 Actual	FY2015-16 Actual	2020 Projected	2025 Projected	2030 Projected	2035 Projected (Buildout)
DEMAND	Potable	2.10	1.39	2.17	2.44	2.71	2.98

	TOTAL	**5.55**	**5.55**	**5.67**	**5.67**	**5.67**	**5.67**

An analysis of drought-year supply and demand is presented in Table 6, below. Drought-years are presented for a single dry year, and for a three-year drought. The SFPUC advises wholesale customers to anticipate seeing their supply allocations reduced to as low as 83% of normal for a single dry year. In multiple dry years, supply may be further reduced to 72% of normal. In Table 6, the supply available from the SFPUC during droughts reflects 83% in the first year and 72% in subsequent years. Groundwater is assumed to be used to meet remaining potable demands in excess of the SFPUC supply. For non-potable (irrigation) use, surface water is assumed to be the primary source, with groundwater meeting the remaining demand. As in the 2017 WSA for the Proposed Project, the water demands would increase in the first dry year due to increased landscape irrigation, and would decrease in subsequent years due to mandatory conservation restrictions.

[5] This table revises values presented in Table 5-1 of the 2017 WSA.

Table 6, Dry Year Supply and Demand Summary (mgd) for Full Offset Housing Alternative [6,7]

Supply	Water Year Type				
	Normal Year	Single Dry Year	Multiple Dry Years		
			1	2	3

Non-potable Demand	1.35	1.42	1.42	1.08	1.08
met by surface water	1.12	0.94	0.94	0.06	0.06
met by groundwater	0.23	0.48	0.48	1.02	1.02
Total Demand	4.33	4.42	4.42	3.61	3.31

Under this Full Offset Housing Alternative, the reduced SFPUC supply during drought periods is less than the projected 2035 campus potable water demand. Groundwater may be used as supplemental potable supply, or more-stringent water conservation measures may need to be implemented on-campus. Table 6 assumes a 15% conservation reduction in potable demand in the second dry year, and a 25% reduction in the third dry year, based upon savings during the 2013-2015 drought. Depending upon the timing of this campus infill development, drought-period shortfalls could occur as early as 2025.

The campus portfolio of water supplies is sufficient to meet the projected water demands during normal, single dry years and multiple dry years. Dry year sufficiency is based upon implementing mandatory water conservation measures and the increased use of groundwater.

Half Offset Housing Alternative

The Half Offset Housing Alternative would add 1,275 additional units/beds to those proposed in the 2018 General Use Permit. The 2018 General Use Permit included the addition of 550 faculty/staff units to the

[6] This table revises values presented in Table 3-1 of the 2017 WSA.

[7] ISL is Interim Supply Limit (valid until 12/31/2018); ISG is Individual Supply Guarantee

campus and this alternative would add 1,171 more, for a total increase of 1,721 new units and a campus total at buildout of 2,658 faculty/staff dwelling units. The 2018 General Use Permit included the addition of 2,600 student beds and this alternative would add 104 more graduate student beds, for a total increase of 2,704 beds and a campus total at buildout of 17,022 student beds. The resulting totals for the Half Offset Housing Alternative are reflected in Table 7, below.

Table 7, Summary of Existing and Proposed Development for Half Offset Alternative[8]

Water use category	Unit of Measure	Existing development in 2012	Completed development 2012-2015	Projected development 2015-2018	Projected development 2018-2020	2018 GUP development 2018-2035	Half Offset Housing Alternative	Total at Buildout Fall 2035

	Groundwater	1.52	1.52	1.52	1.52	1.52	1.52
	Surface Water	1.12	1.12	1.12	1.12	1.12	1.12
	TOTAL	**5.55**	**5.55**	**5.67**	**5.67**	**5.67**	**5.67**

An analysis of drought-year supply and demand is presented in Table 11, below. As in the Full Offset Housing Alternative, groundwater is assumed to meet a portion of the potable demand. It is anticipated that mandatory conservation measures will reduce potable demand by up to 25%, which can then be met using SFPUC supply only.

[10] This table revises values presented in Table 2-4 of the 2017 WSA.
[11] This table revises values presented in Table 5-1 of the 2017 WSA.

Table 11, Dry Year Supply and Demand Summary (mgd) for Half Offset Alternative [12]

Supply	Water Year Type				
	Normal Year	Single Dry Year	Multiple Dry Years		
			1	2	3
Potable Supply (SFPUC)

met by surface water	1.12	0.94	0.94	0.06	0.06
met by groundwater	0.11	0.35	0.35	0.92	0.92
Total Demand	3.33	3.41	3.41	2.77	2.56
2035 Demands					
Potable Demand	2.71	2.73	2.73	2.31	2.03
met by ISG	2.71	2.51	2.51	2.18	2.03
met by groundwater	0.00	0.22	0.22	0.13	0.00
Non-potable Demand	1.35	1.42	1.42	1.08	1.08
met by surface water	1.12	0.94	0.94	0.06	0.06
met by groundwater	0.23	0.48	0.48	1.02	1.02
Total Demand	4.06	4.15	4.15	3.39	3.11

Under this Half Offset Housing Alternative, the reduced SFPUC supply during drought periods is less than the projected 2035 campus potable water demand. Groundwater may need to be used as supplemental potable supply, or more-stringent water conservation measures may need to be implemented on-campus. Depending upon the timing of this campus infill development, drought-period shortfalls could occur as early as 2030.

The campus portfolio of water supplies is sufficient to meet the projected water demands during normal, single dry years and multiple dry years. Dry year sufficiency is based upon implementing mandatory water conservation measures and the increased use of groundwater.

Summary Comparison of 2018 General Use Permit and Housing Alternatives

In the 2017 WSA for the Proposed Project, the existing campus water supplies were determined to be sufficient to meet the projected demand in 2035 under normal, single dry year and multiple dry year conditions. Most importantly, the available potable supply from the SFPUC was determined to be sufficient to meet the campus potable water demands, even with dry year restrictions. In the Housing

[12] This table revises values presented in Table 3-1 of the 2017 WSA.

Alternatives analyzed in this report, the projected potable water demands would exceed the available water supply from the SFPUC during most dry years, but sufficient groundwater supply is available to meet the remaining demand. A comparison of the water demands from the Proposed Project and the two Housing Alternatives is provided in Table 12.

Table 12, Comparison of Water Demand Projections, by Alternative (mgd)[13]

Alternative	Potable by Year Type				Non-Potable by Year Type				Total
	Normal	1st Dry	2nd Dry	3rd Dry	Normal	1st Dry	2nd Dry	3rd Dry	
2018 General Use Permit	2.44				1.35				3.79
		2.46				1.42			3.88
			2.07				1.08		3.15

Memorandum

To	ESA: Paul Mitchell	Pages	1
For	Santa Clara County: David Rader and Kavitha Kumar		
Subject	Peer Review of Stanford's 2018 General Use Permit (GUP) – Housing Alternative Analysis		
From	AECOM: Nichole Seow and Greg Gleichman		
Date	May 7, 2018		

AECOM, as a member of the ESA team, is tasked with conducting a peer review of each transportation-related document submitted as part of the Stanford 2018 General Use Permit (GUP) application to verify that the documents follow generally-acceptable transportation planning practice, address the appropriate study area, and were conducted using methodologies that are clear and replicable.[1] This peer review memo represents AECOM's review of the revised '*Stanford University 2018 General Use Permit Housing Alternatives Transportation Impact Analysis'* dated April 2018, '*Stanford 2018 General Use Permit: Cumulative (2035) Conditions with Four-Lane Page Mill Road from I-280 to Junipero Serra Boulevard*' memo dated 4/23/2018 and '*Response to County Peer Review Comments on the Stanford 2018 General Use Permit Housing Alternatives TIA*' memo dated 4/23/2018.

AECOM finds the information provided sufficient in clarifying and addressing the 8 comments listed in our memo dated April 19, 2018. In addition, ESA has confirmed that comments #6 and #7 have been adequately addressed as well. We therefore have no further questions on the documents listed above.

[1] This language is from the scope of work in the AECOM contract for this project.

FEHR PEERS

MEMORANDUM

Date: April 23, 2018

To: Catherine Palter and Lesley Lowe, Stanford University

From: Ellen Poling and Ashley Brooks, Fehr & Peers

Subject: Stanford 2018 General Use Permit: Cumulative (2035) Conditions with Four-Lane Page Mill Road from I-280 to Junipero Serra Boulevard

SJ15-1585

This memorandum summarizes the results of a sensitivity test performed at the request of Santa Clara County Roads & Airports (SCC R&A) staff. The traffic model used to prepare the Transportation Impact Assessment (TIA) for the proposed Stanford University 2018 General Use Permit assumed that under future Cumulative (2035) Conditions, Page Mill Road between the I-280 interchange and Foothill Expressway would be widened to six lanes. The sensitivity test evaluates whether the 2018 General Use Permit would result in any new significant project or cumulative impacts if Page Mill Road were assumed to remain at four lanes under Cumulative (2035) Conditions.

The scenario evaluated with Page Mill Road as four lanes is referred to as "Four-Lane PMR Cumulative (2035) Conditions". The 2018 General Use Permit: Transportation Impact Analysis Part 2, which presented the results with the original six-lane assumption, is referred to as "TIA Part 2 Cumulative (2035) Conditions".

This memorandum updates the first draft, prepared on December 13, 2017, to incorporate peer review comments provided by AECOM in their December 29, 2017 memorandum, which was provided to Stanford on February 21, 2018. This update also presents the results of the intersection mitigation analysis for the Four-Lane PMR Cumulative (2035) Conditions; the freeway segment impact analysis for the Four-Lane PMR Cumulative (2035) Conditions; and the transit delay analysis for the Four-Lane PMR Cumulative (2035) Conditions.

OVERVIEW: PAGE MILL ROAD LANE GEOMETRY ASSUMPTIONS

Fehr & Peers received the VTA-CCAG model from VTA staff in December 2016 for use in the TIA. Fehr & Peers conducted a review of the land uses and highway network within the traffic study area for Existing Conditions, Year 2020, and Year 2040. The forecasting assumptions are presented in Appendix I of TIA Part 2.

The 2040 VTA-CCAG model, as received, included the widening of Page Mill Road between the I-280 interchange and El Camino Real. Fehr & Peers reviewed the *Page Mill Expressway Corridor Study Report*, dated June 2015, and based on the improvements shown in that report, adjusted the widening assumed in the VTA model to extend only between the I-280 interchange and Foothill Expressway. The intersection geometry used in TIA Part 2 aligned with the geometries presented in Appendix A of the *Page Mill Expressway Corridor Study Report*.

PAGE MILL ROAD SENSITIVITY TESTING

On October 19, 2017, SCC R&A requested that Fehr & Peers re-run the 2040 VTA-CCAG model assuming that Page Mill Road remains four lanes. Fehr & Peers adjusted the 2040 VTA-CCAG model to eliminate widening of Page Mill Road, and re-ran the model. The adjusted 2040 VTA-CCAG model run showed that a portion of the traffic that the 2040 VTA-CCAG model previously had placed on Page Mill Road would shift to Arastradero Road, Foothill Expressway, and other connecting roadways, when Page Mill Road is assumed to remain at four lanes.

Intersection Geometry Modifications

Five intersection lane geometries were adjusted to reflect the four-lane Page Mill Road as compared to the six-lane roadway. **Table 1** shows the geometry assumed under the TIA Part 2 Cumulative (2035) Conditions and Four-Lane PMR Cumulative (2035) Conditions. (The Four-Lane PMR Cumulative (2035) Conditions resembles the existing geometries.)

TABLE 1: INTERSECTION GEOMETRY CHANGES BETWEEN TIA PART 2 CUMULATIVE (2035) AND FOUR-LANE PMR CUMULATIVE (2035)

Notes:
*The Four-Lane PMR Cumulative (2035) Conditions resembles existing conditions.
Bold text indicates geometry that has changed.

SIGNIFICANCE CRITERIA & ANALYSIS METHODOLOGY

The determination of significance for impacts under the Four-Lane PMR Cumulative (2035) Conditions is based on the same policies, regulations, goals, and guidelines defined by Santa Clara County and the surrounding jurisdictions of San Mateo County, Palo Alto, Menlo Park, East Palo Alto, Mountain View, Los Altos, and Atherton that the TIA used to assess significance. These criteria and methods are presented in Chapter 3 of TIA Part 2.

INTERSECTION ANALYSIS

The service levels for the Four-Lane PMR Cumulative (2035) Conditions are shown in **Table 2,** and the TRAFFIX 8.0 calculations sheets may be found in **Attachment A**. **Table 3** shows a side-by-side comparison of service levels for the TIA Part 2 Cumulative (2035) Conditions and the Four-Lane PMR Cumulative (2035) Conditions,

The Four-Lane PMR Cumulative (2035) With Project Conditions analysis resulted in the same impacted locations as the TIA Part 2 Cumulative (2035) With Project Conditions (see below). No additional impact locations are identified for the Four-Lane PMR Cumulative (2035) With Project scenario.

- Intersection #2: I-280 NB Off-Ramp/Sand Hill Road (AM peak hour)
- Intersection #17: Junipero Serra Blvd./Foothill Expressway/Page Mill Road (AM and PM peak hours)
- Intersection #19: Hanover Street/Page Mill Road (AM peak hour)
- Intersection #20: El Camino Real/Page Mill Road-Oregon Expressway (AM and PM peak hours)
- Intersection #21: Middlefield Road/Oregon Expressway (AM peak hour)
- Intersection #29: Foothill Expressway/Hillview Avenue (AM peak hour)
- Intersection #30: Foothill Expressway/Arastradero Road (AM and PM peak hours)
- Intersection #31: Foothill Expressway/San Antonio Road (PM peak hour)
- Intersection #32: Foothill Expressway/El Monte Avenue (AM peak hour)
- Intersection #33: Foothill Expressway/Springer Road-Magdalena Avenue (AM and PM peak hours)
- Intersection #37: El Camino Real/Encinal Avenue (PM peak hour)
- Intersection #38: El Camino Real/Valparaiso Avenue (PM peak hour)
- Intersection #41: El Camino Real/Ravenswood Road (PM peak hour)
- Intersection #48: El Camino Real/Embarcadero Road (PM peak hour)
- Intersection #56: Alma Street/Hamilton Avenue (PM peak hour)
- Intersection #58: Alma Street/Charleston Road (PM peak hour)
- Intersection #59: Middlefield Road/Marsh Road (AM peak hour)
- Intersection #63: Middlefield Road/Lytton Avenue (PM peak hour)
- Intersection #66: Middlefield Road/Embarcadero Road (AM and PM peak hours)
- Intersection #89: Central Expressway/Castro Street-Moffett Boulevard (AM peak hour)
- Intersection #90: Foothill Expressway/Edith Avenue (PM peak hour)

In summary, the suggested adjustment to the 2040 VTA-CCAG model would not change the impact locations of the proposed 2018 General Use Permit compared to the impact locations that were disclosed in TIA Part 2.

INTERSECTION MITIGATION MEASURES

The mitigation measures presented in TIA Part 2 were applied to the impacted intersections under the Four-Lane PMR Cumulative (2035) With Project scenario, to ensure that the mitigations would continue to

mitigate the impacts under this scenario. At all intersections except Intersection #17 (Page Mill Road/Junipero Serra Boulevard – Foothill Expressway), the TIA Part 2 mitigation measures would mitigate the Four-Lane PMR Cumulative (2035) With Project impacts similarly to the results presented in TIA Part 2. At Intersection #17, an additional mitigation component is needed to mitigate the Four-Lane PMR Cumulative (2035) With Project condition. TIA Part 2 identified the following mitigation measure for this intersection: Contribute fair share funding toward installation of an overlap phase for northbound and southbound right-turning vehicles and widening of the southbound approach to two lanes between Page Mill Road and Stanford Avenue to align with the existing designated right-turn lane. To address the Four-Lane PMR Cumulative (2035) With Project condition, the following additional mitigation components would be added:

- addition of a third through lane on Page Mill Road in the westbound direction (for a total of two left-turn lanes, three through lanes and a right turn lane (plus a bike lane)), and
- addition of a receiving lane to westbound Page Mill Road (resulting in three lanes from Junipero Serra Boulevard approximately to Old Page Mill Road).

The results for all significantly impacted intersections are presented below. Where feasible physical capacity improvements or other operational improvements are possible, they have been identified, along with the post-mitigation level of service and resulting impact level of significance. A bicycle and pedestrian QOS evaluation was performed for each mitigation location, to assess the impacts on bicycle and pedestrian conditions of the proposed mitigation, using the methodology described in Chapter 3, Section 3.6.2. These impacts are also described below. **Table 4** summarizes all of this information, for the 21 impact locations. **Attachment B** contains the mitigation LOS calculations. **Attachment C** shows the bicycle and pedestrian StreetScore+ QOS results for Intersection #17, Junipero Serra Boulevard-Foothill Expressway and Page Mill Road because it is the only mitigation location that has changed compared to TIA Part 2. All other StreetScore+ QOS results may be found in Appendix M of TIA Part 2.

Santa Clara County

Junipero Serra Boulevard-Foothill Expressway/Page Mill Road (Intersection #17) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an unacceptable LOS F during the AM and PM peak hours. It would continue to function at LOS F under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors that connect to I-280, and provides a parallel route to I-280. As such, it serves a large existing traffic volume and is projected to serve

substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested intersection in 2035.

The following improvements would be capable of reducing this impact:

- Int. #17 Mitigation: Contribute fair share funding toward
    - (1) addition of a third through lane on Page Mill Road in the westbound direction (for a total of two left-turn lanes, three through lanes and a right turn lane (plus a bike lane));
    - (2) addition of a receiving lane to westbound Page Mill Road (resulting in three lanes from Junipero Serra Boulevard approximately to Old Page Mill Road); and
    - (3) installation of an overlap phase for northbound and southbound right-turning vehicles and widening of the southbound approach to two lanes between Page Mill Road and Stanford Avenue to align with the existing designated right-turn lane.[1]

The new westbound improvements would require some right of way (10-12 feet) from the subdivision corner (northeast) and along the dish parcel for the receiving lane (northwest). Installation of an overlap phase for northbound and southbound right-turning vehicles would be accommodated through the modification of the existing traffic signal, which requires no additional right-of-way. Widening the southbound approach to two lanes between Page Mill Road and Stanford Avenue will likely require the acquisition of additional right-of-way. This improvement would allow southbound right-turning vehicles additional queuing space so southbound through vehicles do not block the right-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because the provision of these improvements may require additional funding that has not yet been identified, Santa Clara County may find that the improvements would not be implemented in a timely manner such that the Project's impact is mitigated. Therefore, the impact would remain **significant and unavoidable.**

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.5 and QOS 4, respectively. With the proposed mitigation, a second lane would be added traveling southbound between Stanford Avenue and Page Mill Road, aligning with the existing designated southbound right-turn lane at Page Mill Road, and would not impact the existing intersection configuration of the southbound approach. A third through lane would be added to the westbound approach and continued on the westbound receiving lanes, requiring additional right-of-way, and increasing the pedestrian crossing distance on the east and west legs of the intersection. In addition, the north/south bicycle crossing distances would increase slightly due to the

[1] The third improvement was identified as a mitigation measure in TIA Part 2 and the Draft EIR. Two additional improvements have been added to ensure the impact is mitigated to a less-than-significant level under the assumption that Page Mill Road is four lanes, rather than six lanes as previously depicted in the VTA 2040 model.

additional through lane while maintaining but not exacerbating the current uncomfortable conditions for bicyclists and pedestrians at the intersection.

It is noted that there is a Tier 1 improvement identified in the draft *Santa Clara County Expressway Plan 2040* to widen Page Mill Road from just east of Junipero Serra Boulevard-Foothill Expressway to the I-280 ramps. The Tier 1 improvement is fully funded through Measure B but conservatively is not anticipated to be in place by 2035. This was evaluated as a potential mitigation measure and was determined not to bring the impact to a less-than-significant level under Four-Lane PMR Cumulative (2035) Conditions. The second improvement at this intersection, a Tier 3 improvement, is to grade separate Page Mill Road. This improvement was not identified as mitigation because the identified mitigation, which is a smaller project and would have fewer secondary environmental effects, mitigates the Project's impact to a less-than-significant level. In addition, the grade separation project has not undergone CEQA review, may not be approved, and may not receive funding.

Hanover Street/Page Mill Road (Intersection #19) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Page Mill Road serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on the local roadway network. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of mitigating this impact:

- Int. #19 Mitigation: Contribute fair-share funding toward installation of a second westbound left-turn lane, identified as an option in the *Page Mill Expressway Corridor Study Report*.

To accommodate the construction of a second westbound left-turn lane, the westbound approach would be widened from three to four lanes and may require the removal of the center median, reduction in lane width, and/or reduction in bicycle lane width at the intersection. The City of Palo Alto has adequate right-of-way to accommodate the dual westbound left-turn lanes and associated receiving lanes on Hanover Street. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. However, because the provision of this improvement may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 4 and QOS 3, respectively. With the proposed mitigation, limited bicycle infrastructure on the north/south approaches would remain as well as the intersection crossing distance, maintaining but not exacerbating the current uncomfortable conditions for bicyclists at the intersection. Pedestrian crossing distances would be unchanged (curb-to-curb) on all approaches. The proposed mitigation measure would not create additional conflicts for the City of Palo Alto's proposed Class I facility on the south side of Page Mill Road as identified in their *Bicycle and Pedestrian Transportation Plan*.

It is noted that there is a Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040*. The improvement is to convert the signal phasing to an eight-phase signal. This improvement is not anticipated to reduce the Project's impact to a less-than-significant level. Therefore, it was not identified as a potential mitigation measure. The proposed mitigation measure does not conflict with the County's Tier 1 intersection improvement.

El Camino Real/Page Mill Road-Oregon Expressway (Intersection #20) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM and PM peak hours. It would continue to function at LOS E in the AM peak hour under Four-Lane PMR Cumulative (2035) No Project Conditions, but it would function at unacceptable LOS F in the AM peak hour under Four-Lane PMR Cumulative (2035) With Project Conditions. In addition, it would function at unacceptable LOS F in the PM hour under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions where Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors, one connecting to I-280 and US 101 and the other traversing the peninsula and south bay. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested intersection in 2035.

The following physical improvements are capable of mitigating this impact:

- Int. #20 Mitigation: Contribute fair-share funding toward the reconfiguration of the east leg of the intersection to include one right-turn lane, two through lanes, two extended left-turn lanes, two receiving lanes, and no on-street parking; and to the extension of the double left-turn lanes as identified in the *Page Mill Expressway Corridor Study Report*.

To accommodate the reconfiguration of the east leg of the intersection, parking would need to be removed along the south side of Page Mill Road and the median island would need to be shifted further to the south to accommodate the additional westbound lane. Little to no right-of-way would be needed to

accommodate this improvement; however, an easement on the north side of the roadway to preserve the sidewalk width would be needed, and the existing bus stop located on the southeast corner of the intersection on Oregon Expressway may need to be relocated or further addressed during design. These improvements are identified in Santa Clara County's *Page Mill Corridor Expressway Plan*, and the extension of the double westbound left-turn lanes is identified as a Tier 1 improvement in the draft *Santa Clara County Expressway Plan 2040* along with enhanced pedestrian facilities on the southwest and southeast corners of the intersection. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. The Tier 1 improvements are fully funded through Measure B. However, because the provision of the remaining improvements may require additional funding that has not yet been identified and all improvements at this intersection would require approval from Caltrans, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable.**

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 4. With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions assuming the parking is removed next to the eastbound receiving lanes, with right-turn slip lanes and/or high vehicle turning speeds preserving uncomfortable environments at the intersection. The proposed mitigation measure would not conflict with the City of Palo Alto's *Bicycle and Pedestrian Transportation Plan* to implement a Class III facility on Oregon Expressway east of the intersection.

Middlefield Road/Oregon Expressway (Intersection #21) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Four-Lane PMR Cumulative (2035) No Project Conditions and under Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more in the AM peak hour. This intersection serves two major corridors, one connecting to I-280, El Camino Real, and US 101, and the other traversing the City of Palo Alto and adjacent communities. As such, it serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested intersection in 2035.

Due to the close proximity of the Oregon Avenue frontage road and the County's desire to preserve the shoulder striping along Oregon Expressway for use by bicyclists, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

Foothill Expressway/Hillview Avenue (Intersection #29) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

Due to the close proximity of the Miranda Avenue/Hillview Avenue intersection and lack of improvement identified in the Santa Clara *County Expressway Plan 2040* at this intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle StreetScore+ QOS would not be affected.

Foothill Expressway/Arastradero Road (Intersection #30) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour and LOS F in the PM peak hour. It would function at unacceptable LOS F in the AM and PM peak hours under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would decrease the average critical delay in the PM peak hour and increase the average critical delay by more than four seconds in the AM peak hour and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors, one connecting to I-280, El Camino Real, and US 101, and the other connecting the Cities of Menlo Park, Palo Alto, Los Alto and Mountain View. As such, the intersection serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested intersection in 2035.

The following physical improvements are capable of mitigating this impact:

- Int. #30 Mitigation: If such grade separation is approved and implemented, contribute fair-share funding toward grade separation as identified in the draft *Santa Clara County Expressway Plan 2040*. The grade separation assumed for purposes of analysis includes a separated throughway for vehicles on Foothill Expressway.

Although the configuration of this proposed interchange has yet to be determined, additional right-of-way would be required to construct this improvement. Due to the close proximity of the Miranda Avenue/Arastradero Road intersection, additional modifications to roadway alignment and turning movements would need to be evaluated along with adequate access for bicyclists and pedestrians. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this Tier 3 improvement has not undergone CEQA review, may not be approved, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

With the exception of construction related impacts, the mitigation would not have a substantial adverse effect on bicycle QOS, which would remain at QOS 3.5. Right-turn lanes and high vehicle speeds would continue to cause uncomfortable conditions for bicyclists at the intersection. However, the mitigation would cause pedestrian QOS to improve from QOS 4 to QOS 2.5. With the proposed mitigation, the pedestrian crossing distances at the northbound and southbound approaches would be reduced from the existing 6+ lanes to an estimated three lanes, providing more favorable pedestrian crossing conditions at the intersection.

Foothill Expressway/San Antonio Road (Intersection #31) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the PM peak hour. It would function at LOS F under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #31 Mitigation: Contribute fair-share funding toward the construction of a third southbound through lane on Foothill Expressway between San Antonio Road and El Monte Avenue as identified in the draft *Santa Clara County Expressway Plan 2040*.

A third receiving lane would be added on the south leg of Foothill Expressway as identified as a Tier 1 improvement in the *Santa Clara County Expressway Plan 2040* to extend the southbound right-turn lane from El Monte Avenue to San Antonio Road, which will likely require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this improvement would

require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle QOS; the bicycle QOS would remain unchanged at QOS 4. With the proposed mitigation, right-turn slip lanes and high vehicle turning speeds would remain preserving uncomfortable environments for bicyclists at the intersection.

There is no pedestrian access at this intersection; therefore, the proposed mitigation measure would have no effect on pedestrian quality of service.

It is noted that the full Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040* includes widening Foothill Expressway from four to six lanes between San Antonio Road and El Monte Avenue. The proposed mitigation implements the southbound widening.

Foothill Expressway/El Monte Avenue (Intersection #32) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions causes a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at LOS F under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more in the AM peak hour. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #32 Mitigation: Contribute fair-share funding toward the construction of a third northbound through lane at the intersection and associated receiving lane as identified in the draft *Santa Clara County Expressway Plan 2040*.

To accommodate the construction of a third northbound through lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. The receiving lanes on the north side of the intersection would also need to be widened as identified as a Tier 1 improvement in the *Santa Clara County Expressway Plan 2040* to extend the northbound right-turn lane from San Antonio Road to El Monte Avenue, which will likely require additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. The Tier 1 improvements are fully funded through Measure B. Because the remainder of these improvements would require additional funding

that has not yet been identified, Santa Clara County may find that this improvement will not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian QOS would remain unchanged, at QOS 4 (for both). The east/west bicycle and pedestrian crossing distances would increase slightly due to the additional through lane and continue to have right-turn slip lanes and high vehicle turning speeds, while maintaining the current quality of service score.

It is noted that the full Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040* Includes widening Foothill Expressway from four to six lanes between San Antonio Road and El Monte Avenue. The proposed mitigation implements the northbound widening, but the southbound widening, although would increase the available storage capacity, would not reduce the Project's AM peak hour impact to a less-than-significant level. Therefore, the southbound widening was not identified as a potential mitigation measure at this intersection.

Foothill Expressway/Springer Road–Magdalena Avenue (Intersection #33) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM and PM peak hours. It would function at unacceptable LOS F in the AM and PM peak hours under Four-Lane PMR Cumulative (2035) No Project Conditions and Four-Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #33 Mitigation: Contribute fair-share funding toward the following improvements:
    - Convert to an eight-phase signal as identified in the draft *Santa Clara County Expressway Plan 2040*
    - Change the lane configuration for the east leg to have two left-turn lanes, one through lane, and one right-turn lane
    - Change the lane configuration for the west leg to have one left-turn lane, two through lanes, and one right-turn lane

Converting the existing phasing to an eight-phase signal with the associated lane configuration changes above is identified as a Tier 2 improvement in the Santa Clara County *Expressway Plan 2040*. In order to accommodate an eight-phase signal, the eastbound and westbound left-turn movements would require designated left-turn lanes and may require the acquisition of additional right-of-way. The above mitigation measure would reduce the Project's impact to a less-than-significant level while also incorporating the Tier 2 improvement. In order to accommodate this improvement, the center median on the west leg of the intersection would need to be shifted to incorporate a designated left-turn lane and remove one receiving lane from the west leg. The eastbound approach would require re-striping to change the shared left-turn/through lane to a designated left-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. However, because the provision of this improvement may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable.**

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 3.5 and QOS 4, respectively. With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions, with right-turn slip lanes and high vehicle turning speeds maintaining the current uncomfortable environment at the intersection. To construct the designated eastbound left-turn lane, the eastbound lanes will be narrowed and the center median may be reduced resulting in the same curb-to-curb width, but increasing the number of travel lanes. The proposed mitigation would not adversely affect the City of Los Alto's existing Class II bicycle facilities at the Foothill Expressway/Springer Road-Magdalena Avenue intersection.

It is noted that the full Tier 2 intersection improvement identified for this intersection in the draft Santa Clara County Expressway Plan 2040 includes converting to an eight-phase signal, operational/safety improvements at the County Club Drive intersection, and potentially adding a signal at the adjacent Berry Avenue intersection. The proposed mitigation implements the eight-phase signal and associated lane configuration changes at the intersection.

Central Expressway/Castro Street-Moffett Boulevard (Intersection #89) – The addition of Project traffic under Four-Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County CMP signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS E in the AM peak hour. It would function at LOS F under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Central Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on parallel routes

including US 101. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #89 Mitigation: Close Castro Street at the train tracks to form a T-intersection of Central Expressway and Moffett Boulevard, consistent with recommendations in the *Mountain View Transit Center Master Plan (May 2017)*.

It is noted that there is a Tier 1 intersection improvement identified for this intersection in the draft *Santa Clara County Expressway Plan 2040*. The improvement is to grade separate the train tracks from the intersection. Although this improvement would increase the available capacity at the intersection and would reduce the Project's impact to a less-than-significant level, the City of Mountain View has approved plans to close Castro Street (the west leg) at the train tracks, which would change the current four-leg intersection to a T-intersection of Central Expressway and Moffett Boulevard. This improvement will not require any additional right-of-way if implemented by the City of Mountain View. Given that this is the City's preferred improvement and would reduce the Project's impact to a ***less-than-significant*** level, the closure of Castro Street is the identified mitigation measure at this intersection; if Castro Street is closed, Stanford would not need to contribute to any improvements at this intersection. Because this improvement would require approval from the City of Mountain View, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation is anticipated to improve bicycle and pedestrian QOS; the bicycle QOS would shift from 3.3 to 1.7 and the pedestrian QOS would shift from 4 to 2. With the closure of Castro Street, pedestrian and bicycle crossings will be moved to a separated underground facility to cross Central Expressway and the Caltrain tracks with the exception of the east leg of the intersection where pedestrian crossings would still occur at grade. Northbound and southbound bicyclists would continue to travel on Central Expressway, but bicyclists traveling from Moffett Boulevard to Castro Street would use the underground crossing.

If the closure of Castro Street is not implemented in a timely manner and/or the City of Mountain View does not pursue the improvement, a second back-up mitigation measure is proposed. The following secondary physical improvements are capable of reducing this impact to a less than significant level:

- Int. #89 Mitigation Alternative: If the City of Mountain View does not close Castro Street, contribute fair-share funding toward the construction of a second southbound left-turn lane from Central Expressway to Moffett Boulevard.

To accommodate the construction of a second southbound left-turn lane, the Central Expressway center median would need to be reduced and/or removed, and the improvement would not require any additional

right-of-way. Given the existing and proposed geometry, signal timings may also need to be adjusted to lead-lag lefts to account for potential truck turn conflicts. With this mitigation, the impact would be reduced to a less-than-significant level. Because this improvement would require approval from the City of Mountain View, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain significant and unavoidable.

Foothill Expressway/Edith Avenue (Intersection #90) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Santa Clara County signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the PM peak hour. It would function at unacceptable LOS F in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Foothill Expressway serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators, due to the limited available capacity on parallel routes including I-280. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

Due to the close proximity of the residential units and retail space near the intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

City of Palo Alto

El Camino Real/Embarcadero Road (Intersection #48) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto / Santa Clara County CMP signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at acceptable LOS E in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions, but would function at unacceptable LOS F in the PM peak hour under Four Lane PMR Cumulative (2035) With Project Conditions. This intersection serves two major corridors, one connecting to US 101 and the other traversing the peninsula and south bay. The intersection serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested intersection in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #48 Mitigation: Contribute fair-share funding toward the addition of a second northbound left-turn lane.

To accommodate the construction of a second northbound left-turn lane, the northbound approach would be widened from four to five lanes by potentially reducing the lane widths, reducing the width of the center median, and/or removing on-street parking for the length of the additional left-turn pocket and taper. Right-of-way may be required to accommodate the second northbound left-turn lane. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto and Caltrans, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**.

The VTA El Camino Real Bus Rapid Transit (BRT) Project would upgrade the 522 Rapid Bus Route to have Bus Rapid Transit status. The geometric alternatives included in the draft Environmental Impact Report for the BRT Project do not include a separate bus lane through this intersection. Some alternatives studied include the creation of outboard bus lanes through the removal of parking on the south side of El Camino Real. Since there is no final design for this intersection and the BRT project completion data is uncertain, it is not possible to determine what, if any, effect of the mitigation would have on the BRT Project. However, the existing bus stop on the northeast corner on El Camino Real may block through traffic when boarding and alighting passengers if the proposed mitigation measure is built. This is typical for bus stops on El Camino Real and other major arterials.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 3.8 and QOS 4, respectively. With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions, but would add an additional travel lane on the south leg of the intersection, with right-turn slip lanes and high vehicle turning speeds maintaining the current uncomfortable environment at the intersection. This proposed mitigation would not adversely affect the City of Palo Alto's proposed Class III facilities as identified in their *Bicycle and Pedestrian Transportation Plan*. It should be noted that the City is currently designing bicycle improvements at this intersection.

Alma Street/Hamilton Avenue (Intersection #56) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS B in the PM peak hour. It would function at unacceptable LOS E in the PM peak hours under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Alma Street provides a key north-south connection in Palo Alto and communities to the south, and given the limited capacity on parallel routes such as El Camino Real, it is projected to serve substantial traffic

growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #56 Mitigation: Contribute fair-share funding toward the reconfiguration of the westbound approach to have one left-turn lane and one right-turn lane, by removing on-street parking.

By removing on-street parking, the reconfiguration of the westbound approach to have one left-turn lane and one right-turn lane would not require the acquisition of additional right-of-way, but would require the removal of potentially four on-street parking spaces on the north side of Hamilton Avenue. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. However, because the provision of this improvement may require additional funding that has not yet been identified as well action by the City of Palo Alto, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is avoided or mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain QOS 2.5 and QOS 2, respectively. With the proposed mitigation, bicycle and pedestrian crossing distances would remain unchanged (curb-to-curb) in all directions, with a single right-turn lane in the westbound direction and low vehicle turning speeds, preserving a generally comfortable environment at the intersection. This proposed mitigation would not adversely affect the City of Palo Alto's proposed Class III facilities as identified in their *Bicycle and Pedestrian Transportation Plan*.

Alma Street/Charleston Road (Intersection #58) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS F in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two major corridors serving Palo Alto and Mountain View, including connections to US 101, El Camino Real and I-280. As such, it is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #58 Mitigation: Contribute fair-share funding toward the addition of a designated northbound right-turn lane and install an overlap phase for the northbound and southbound right-turn movements.

To accommodate the construction of a designated northbound right-turn lane, the northbound approach would need to be widened and will likely require the acquisition of additional right-of-way. Installation of an overlap phase for northbound and southbound right-turning vehicles would be accommodated through the modification of the existing traffic signal. With this mitigation, the level of service would be improved and the impact would be reduced, but not to a less than significant level. Therefore, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.3 and QOS 3.5, respectively. With the proposed mitigation, pedestrian crossing distances would increase slightly on the south leg of the intersection and remain unchanged on all other approaches while maintaining the current quality of service score at the intersection. Bicycle lanes on the eastbound and westbound approaches, and low right-turn speeds would remain, resulting in slightly better conditions compared to what bicyclists experience on the northbound and southbound approaches. The proposed mitigation measure would not conflict with the City of Palo Alto's proposed Class III facility along Alma Street as identified in the City of Palo Alto Bicycle & Pedestrian Transportation Plan. With a Class III facility, bicyclists travel in the vehicle lane and do not require a separated space as with a bicycle lane.

Middlefield Road/Lytton Avenue (Intersection #63) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. Middlefield Road provides a key north-south connection in Palo Alto and communities to the north and south, and given the limited capacity on parallel routes such as El Camino Real, it is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

Due to the close proximity of the residential units near the intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

It is noted that a mitigation was identified for this intersection in the *Menlo Park Facebook Campus Expansion Project FEIR (November 2016)*. The mitigation was to add a second eastbound left-turn lane. However, because of the inability to widen the roadway due to the close proximity of the residential units, it is considered infeasible.

Middlefield Road/Embarcadero Road (Intersection #66) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions causes a significant impact based on the significance criteria for a City of Palo Alto signalized intersection during the AM and PM peak hours. Under Existing Conditions, this intersection functions at an acceptable LOS C and D in the AM and PM peak hours, respectively. It would function at unacceptable LOS E in the AM and PM peak hours under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project conditions. Project-generated traffic would increase the average critical delay by more than four seconds and would increase the critical volume-to-capacity ratio by 0.01 or more. This intersection serves two key transportation corridors connecting to US 101 and El Camino Real, and connecting Palo Alto to communities to the north and south. As such, it is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

Based on the close proximity of the residential units near the intersection, no feasible mitigation measures have been identified. Therefore, the impact would remain **significant and unavoidable.** Since no mitigation is proposed, the pedestrian and bicycle QOS would not be affected.

City of Menlo Park

I-280 Northbound Off-Ramp/Sand Hill Road (Intersection #2) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions causes a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the AM peak hour. It would function at unacceptable LOS F in the AM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and under Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average delay on the eastbound through (local) approach by more than 0.8 seconds. The poor AM peak hour conditions in 2035 are the result of a substantial increase in non-Project traffic growth at the Sand Hill Road interchange, along with Project traffic primarily entering the northbound ramps intersection from the west (i.e. from the southbound off-ramp).

The following physical improvements are capable of reducing this impact:

- Int. #2 Mitigation: Contribute fair-share funding toward the addition of a second northbound right-turn lane as identified in the *ConnectMenlo Final Environmental Impact Report*.

To accommodate the construction of a second northbound right-turn lane, the northbound approach would be widened from two to three lanes and may require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this improvement depends on the actions of Caltrans and the City of Menlo Park, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in

a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and QOS; the bicycle StreetScore+ QOS would remain at QOS 4. With the proposed mitigation, limited infrastructure to accommodate bicycle and pedestrian crossings, coupled with high vehicle speeds along Sand Hill Road, create an uncomfortable condition for bicyclists and pedestrians at the intersection. Aside from an eastbound bicycle lane, there are no other bicycle or pedestrian facilities at this intersection. The northbound right-turn lane from the off-ramp to Sand Hill Road is currently protected; meaning vehicles are not permitted to turn right on red. The addition of a second northbound right-turn lane would not conflict with eastbound bicyclists if the right-turn lanes were to remain protected.

Pedestrians interested in walking across the interchange must do so on the northern bridge that carries westbound traffic. The proposed mitigation measure would have no effect on pedestrian quality of service as pedestrians are not allowed at the intersection.

El Camino Real/Encinal Avenue (Intersection #37) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the PM peak hour. It would function at unacceptable LOS F in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average delay on the westbound right-turn (critical) movements by more than 0.8 seconds. El Camino Real is a major north-south corridor serving the peninsula and south bay, which serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #37 Mitigation: Contribute fair-share funding toward the conversion of the northbound right-turn lane to a shared through/right-turn lane by removing on-street parking.

By removing on-street parking on the east side of El Camino Real, the conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this improvement depends on the actions of the City of Menlo Park and Caltrans, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain at QOS 2.8 and QOS 2.7, respectively. With the proposed mitigation, pedestrian crossing distances would remain unchanged (curb-to-curb) on all approaches. Low right-turn speeds and short right-turn lanes would remain, maintaining better conditions for bicyclists traveling along the eastbound and westbound approaches, compared to what bicyclists experience on El Camino Real. While the bicycle StreetScore+ QOS at the northbound approach will not improve, bicyclists will no longer move left across the right-turn conflict area and RTOR will be reduced, because vehicles will no long have a designated turn lane. The San Mateo *County Comprehensive Bicycle and Pedestrian Plan* (2011) proposes Class II facilities on El Camino Real between Valparaiso Avenue and Alejandra Avenue while the City of Menlo Park *Comprehensive Bicycle Development Plan* (2005) proposed Class III facilities on El Camino Real at Encinal Avenue. The proposed mitigation measure could conflict with a Class II facility (bicycle lane) if only on-street parking is removed in order to add a third through lane. However, if the center median were narrowed, space for a bicycle lane could be provided. The proposed mitigation measure would not conflict with a Class III facility. The existing bus stop on the northeast corner on El Camino Real may block through traffic when boarding and alighting passengers if the proposed mitigation measure is constructed. However, this is typical for bus stops on El Camino Real and other major arterials.

El Camino Real/Valparaiso Avenue (Intersection #38) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average delay on the eastbound left-turn and westbound through (critical) movements by more than 0.8 seconds. El Camino Real is a major north-south corridor serving the peninsula and south bay, which serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #38 Mitigation: Contribute fair-share funding toward the conversion of the northbound right-turn lane to a shared through/right-turn lane by removing on-street parking.

By removing on-street parking on the east side of El Camino Real, the conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this improvement depends on the actions of the City of Menlo Park and Caltrans, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be

implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; with the proposed mitigation, the bicycle and pedestrian StreetScore+ QOS would remain at QOS 3.3 and QOS 4, respectively. With the proposed mitigation, pedestrian crossing distances would remain unchanged (curb-to-curb) across all legs of the intersection, maintaining the current uncomfortable crossing conditions. Bicycle lanes and low right-turn speeds would remain along Valparaiso Avenue, maintaining better conditions for bicyclists traveling along the eastbound and westbound approaches, compared to what bicyclists experience on El Camino Real. While the bicycle StreetScore+ QOS at the northbound approach would not improve, bicyclists would no longer move left across the right-turn conflict area and RTOR will be reduced because vehicles would no long have a designated turn lane. The San Mateo *County Comprehensive Bicycle and Pedestrian Plan* (2011) and the City of Menlo Park *Comprehensive Bicycle Development Plan* (2005) propose Class III facilities on El Camino Real at Valparaiso Avenue. The proposed mitigation measure would not conflict with a Class III facility.

El Camino Real/Ravenswood Road (Intersection #41) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a City of Menlo Park signalized intersection during the PM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS D in the PM peak hour. It would function at unacceptable LOS E in the PM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase the average delay on the eastbound and westbound left-turn (critical movements by more than 0.8 seconds. El Camino Real is a major north-south corridor serving the peninsula and south bay, which serves a large existing traffic volume and is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #41 Mitigation: Contribute fair-share funding toward the conversion of the northbound right-turn lane to a shared through/right-turn lane by removing on-street parking.

The conversion of the northbound right-turn lane to a shared through/right-turn lane would not require the acquisition of additional right-of-way. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this improvement depends on the actions of the City of Menlo Park and Caltrans, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The mitigation would not have a substantial adverse effect on bicycle and pedestrian QOS; the bicycle and pedestrian StreetScore+ QOS would remain unchanged at QOS 3.5 (for both). With the proposed mitigation, pedestrian crossing distances would remain unchanged (curb-to-curb) across all legs of the intersection, maintaining the current crossing conditions. Bicycle routes and low right-turn speeds would remain along Ravenswood Road, maintaining better conditions for bicyclists traveling in the eastbound and westbound directions, compared to what bicyclists experience on El Camino Real. While the bicycle StreetScore+ QOS at the northbound approach will not improve, bicyclists would no longer move left across the right-turn conflict area and RTOR would be reduced because vehicles would no long have a designated turn lane. The San Mateo *County Comprehensive Bicycle and Pedestrian Plan* (2011) and the City of Menlo Park *Comprehensive Bicycle Development Plan* (2005) propose Class III facilities on El Camino Real at Valparaiso Avenue. The proposed mitigation measure would not conflict with a Class III facility.

City of East Palo Alto

No significant impacts are identified for East Palo Alto intersections.

Town of Atherton

Middlefield Road/Marsh Road (Intersection #59) – The addition of Project traffic under Four Lane PMR Cumulative (2035) With Project Conditions would cause a significant impact based on the significance criteria for a Town of Atherton signalized intersection during the AM peak hour. Under Existing Conditions, this intersection functions at an acceptable LOS C in the AM peak hour. It would function at unacceptable LOS E in the AM peak hour under Four Lane PMR Cumulative (2035) No Project Conditions and Four Lane PMR Cumulative (2035) With Project Conditions. Project-generated traffic would increase average critical delay by more than four seconds and increase the volume to capacity ratio by 0.01 or more. This intersection serves a key north-south connector roadway in the region, and a key connecting roadway which provides access to US 101. As such, it is projected to serve substantial traffic growth from other non-Project regional generators. The significant impact is thus the result of adding Project traffic to an already-congested corridor in 2035.

The following physical improvements are capable of reducing this impact:

- Int. #59 Mitigation: Contribute fair-share funding toward the addition of a second westbound left-turn lane and add a second receiving lane on the south leg, consistent with the recommendations in the *ConnectMenlo Final EIR (November 2016*) and the *Middle Plaza at 500 El Camino Real Draft EIR (March 2017)*.

Right-of-way acquisition would be required to accommodate the construction of a second westbound left-turn lane and a second receiving lane on the south leg. This mitigation measure may also be found in the Facebook Campus Expansion FEIR and the Menlo Gateway FEIR. The Town of Atherton has preliminary plans

to redesign the intersection. With this mitigation, the impact would be reduced to a ***less-than-significant*** level. Because this improvement depends on the actions of the City of Menlo Park and Town of Atherton, and may require additional funding that has not yet been identified, Santa Clara County may find that this improvement would not be implemented in a timely manner such that the Project's impact is mitigated. In such case, the impact would remain **significant and unavoidable**.

The proposed mitigation would cause the bicycle StreetScore+ QOS to fall from QOS 2.7 to QOS 3; the pedestrian StreetScore+ QOS would remain at QOS 3. With the proposed mitigation, a second receiving lane would be added on the southbound approach, causing an uncomfortable situation where bicyclists travel along a four-lane roadway compared to a three-lane roadway existing today. Missing sidewalks and curb ramps cause uncomfortable situations for pedestrians at all intersection crossings.

FREEWAY SEGMENT ANALYSIS

The Four-lane PMR Cumulative (2035) with Project scenario results in two additional freeway segments meeting the significance criteria as compared to the freeway segments identified in the TIA Part 2 Cumulative (2035) with Project Conditions, identified below. Freeway segments with significant Project impacts under Four-Lane PMR Cumulative (2035) With Project Conditions are:

- Northbound State Route 85
    - South De Anza Boulevard to Stevens Creek Boulevard (AM peak hour);
    - Stevens Creek Boulevard to I-280 (AM Peak hour);
- Southbound State Route 85
    - Stevens Creek Boulevard to South De Anza Boulevard (PM peak hour);
- Northbound Interstate 280
    - Wolfe Road to De Anza Boulevard (AM peak hour);
    - State Route 85 to Foothill Expressway (AM and PM peak hours);
    - Foothill Expressway to Magdalena Avenue (AM peak hour);
    - Sand Hill Road to Woodside Road (PM peak hour);
- Southbound Interstate 280
    - Sheep Camp Trail to Edgewood Road (AM peak hour);
    - Woodside Road to Sand Hill Road (AM peak hour)*
    - Magdalena Avenue to Foothill Expressway (PM peak hour);
    - Foothill Expressway to State Route 85 (PM peak hour);
    - State Route 85 to De Anza Boulevard (PM peak hour)*
    - De Anza Boulevard to Wolfe Road (PM peak hour).

*Indicates this impact location is new compared to the TIA Part 2 Cumulative (2035) with Project Conditions.

Attachment D includes the freeway V/C ratio calculations, levels of service, and impact assessment.

FREEWAY SEGMENT MITIGATIONS

The mitigation discussion presented in TIA Part 2 continues to be applicable to the impacted freeway segments under the Four-Lane PMR Cumulative (2035) With Project scenario. The Project is determined to cause a significant impact to freeway facilities based on the criteria described in Chapter 3 of TIA Part 2. Implementation of the Project would increase vehicle traffic and congestion, resulting in either unacceptable freeway segment LOS or increases in traffic volumes that would exceed the allowable percent increase threshold. This would be considered a significant impact on thirteen segments under the Four-Lane PMR Cumulative (2035) with Project Conditions.

There are limited options to widen the impacted freeway segments due to right-of-way constraints. Additionally, the widening of roadways can lead to other effects, such as induced travel demand (e.g., more vehicles on the roadway due to increased capacity on a particular route), air quality degradation, increases in noise associated with motor vehicles, and reductions in transit use (less congestion or reduced driving time may make driving more attractive than transit travel).

Mitigation of freeway impacts is considered beyond the scope of an individual development project, due to the inability of any individual project or local agency to:

1. Acquire right-of-way for freeway widening, Freeway improvements would require approval by VTA and Caltrans, and as such the local agency cannot guarantee implementation of any improvement in the freeway right-of-way.
2. Fully fund a major freeway mainline improvement. To provide adequate funding, additional sources would be needed, which may include State Transportation Improvement Program funds for projects identified in the VTP, local agency impact fees, and/or a future regional impact fee. The County of Santa Clara could potentially participate in development of a regional fee should it be proposed by regional agencies, such as VTA.

For these reasons, the Project's freeway impacts would remain **significant and unavoidable**.

TRANSIT DELAY ANALYSIS

The Project would add traffic along major transit corridors throughout the Cities of Palo Alto and Menlo Park, which could affect operations of VTA and SamTrans bus routes. The bus routes evaluated along with the methodology for estimating this delay are described in Chapter 3 of TIA Part 2. The additional delay to transit service in the area due to implementation of the Project can be found in **Table 5**. Attachment E contains the calculation summary for each transit route.

The Project would not substantially increase transit delay relative to the total route travel times, for the transit routes identified in Transit Service Analysis Methods. As shown in **Table 5**, the traffic created by the Project in 2035 would increase the travel times by less than 30 seconds on all but three routes. VTA Route 22 would experience a longer delay change, at 35.8 seconds (eastbound direction in the PM peak hour only), VTA Route 522 experiences a longer delay change, at 34.1 seconds (eastbound direction in the PM peak hour only), and Dumbarton Express 1 experiences a longer delay change, at 31.1 seconds (westbound in the AM peak hour only).

TABLE 5: FOUR-LANE PMR CUMULATIVE (2035) WITH PROJECT TRANSIT ROUTE DELAY

Route		Direction	Peak Hour	Additional Route Average Delay with Project (seconds)[1]
22	Palo Alto Transit Center to Eastridge Transit Center via El Camino	Eastbound	AM PM	12.2 35.8
		Westbound	AM PM	20.9 17.4
35	Downtown Mountain View to Stanford Shopping Center	Northbound	AM PM	11.8 22.0
		Southbound	AM PM	16.7 13.2
89	California Avenue Caltrain Station to Palo Alto Veterans Hospital	Northbound	AM PM	< 5.0 < 5.0
		Southbound	AM PM	< 5.0 < 5.0
102	South San Jose to Palo Alto	Northbound	AM	< 5.0
		Southbound	PM	16.7
104	Penitencia Creek Transit Center to Palo Alto	Eastbound	PM	< 5.0
		Westbound	AM	26.3
522	Palo Alto Transit Center to Eastridge Transit Center	Eastbound	AM PM	9.1 34.1
		Westbound	AM PM	20.9 17.4
281	Onetta Harris Center to Stanford Shopping Center	Eastbound	AM PM	6.5 9.6
		Westbound	AM PM	< 5.0 < 5.0
ECR	Daly City BART to Palo Alto Transit Center	Northbound	AM PM	< 5.0 10.0
		Southbound	AM PM	< 5.0 < 5.0
DB	Dumbarton Express - Union City BART to Stanford Oval	Eastbound	AM PM	< 5.0 7.4

TABLE 5: FOUR-LANE PMR CUMULATIVE (2035) WITH PROJECT TRANSIT ROUTE DELAY

Route		Direction	Peak Hour	Additional Route Average Delay with Project (seconds)[1]
DB1	Dumbarton Express 1 - Union City BART to Stanford Research Park	Westbound	AM PM	22.6 9.2
		Eastbound	AM PM	< 5.0 8.6
U	Fremont BART to Stanford Oval	Westbound	AM PM	31.1 26.2
		Eastbound	PM	29.4
E	University Avenue Caltrain Station to Baylands Business Parks	Westbound	AM	17.0
		Eastbound	AM PM	5.9 14.2
		Westbound	AM PM	11.8 < 5.0
C	University Avenue/Downtown to South Palo Alto at Charleston Road	Eastbound	AM PM	< 5.0 8.9
		Westbound	AM PM	29.1 6.3

Note:

1. The Project was not considered to have a measureable change in overall transit delay if the increase in travel time was less than five seconds or the travel time improved slightly (due to changes in signal timing, critical movement changes, etc.).

				PM	17.3	B	17.2	B	0.005	0.0

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

*Indicates unsignalized intersection.

2. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
   (SC CMP) – CMP intersection in Santa Clara County
   (SM CMP) – CMP intersection in San Mateo County
3. LOS Threshold is the threshold between acceptable and unacceptable level of service.
4. AM = morning peak hour, PM = evening peak hour.
5. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
6. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
7. Change in critical volume to capacity ratio between Four-Lane PMR Cumulative (2035) and Four-Lane PMR Cumulative (2035) With Project Conditions. This ratio is not applicable for side-street stop controlled intersections and is denoted by "N/A".
8. Change in average critical movement delay between Four-Lane PMR Cumulative (2035) and Four-Lane PMR Cumulative (2035) With Project Conditions. This ratio is not applicable for side-street stop controlled intersections and is denoted by "N/A".
9. A signal warrant is not met for this intersection.

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
   (SC CMP) – CMP intersection in Santa Clara County
   (SM CMP) – CMP intersection in San Mateo County
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections.
5. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
6. A signal warrant is not met for this intersection

Notes: **Bold text** indicates intersection operates at unacceptable level of service. **Bold and highlighted text** indicates a significant impact.

1. Intersection jurisdiction and identification of CMP (Congestion Management Program) intersections.
2. LOS Threshold is the threshold between acceptable and unacceptable level of service.
3. AM = morning peak hour, PM = evening peak hour.
4. Whole intersection weighted average control delay expressed in seconds per vehicle calculated using methods described in the 2000 *Highway Capacity Manual*, with adjusted saturation flow rates to reflect Santa Clara County Conditions for signalized intersections. For side-street stop-controlled intersections, delay and LOS are reported for the worst-case approach.
5. LOS = Level of Service. LOS calculations conducted using the TRAFFIX 8.0 analysis software packages, which applies the methods described in the 2000 *Highway Capacity Manual*.
6. Based on average pedestrian StreetScore+ Quality of Service of all intersection legs. See Attachment C for calculations.
7. Based on average bicycle StreetScore+ Quality of Service of all intersection legs. See Attachment C for calculations.
8. LTS = less-than-significant with mitigation, SU = significant and unavoidable. LTS/SU = less-than-significant with mitigation, but is either (1) located outside Santa Clara County where mitigation measures depend on funding and actions by other jurisdictions, or (2) located in Santa Clara County but depends on other funding for the mitigation to be constructed and thus the mitigation measure may not be implemented in a timely manner to avoid the impact. Significance determination is based on draft mitigation and responsible jurisdiction of the intersection.

Notes:

Bold text indicates unacceptable operations (V/C ratio>1)

Bold and highlighted indicates a significant impact.

1. AM = morning peak hour, PM= evening peak hour

2. Existing lanes within Santa Clara County are from 2014 and are presented in the VTA *2014 Conformance and Monitoring Report* . Exsiting lanes within San Mateo County are from 2015 and a presented in the *C/CAG Level of Service and Performance Measure Monitoring Report 2015* .

3. The 2018 freeway network was obtained from VTA staff for use in the 2020 forecasting model and was assumed to be completed by 2018.

4. Freeway capacity is assumsed to be 2,200 vehicles per hour per lane (vphpl) for two lanes or less mixed-flow lanes and 2,300 vphpl for three or more mixed-flow lanes. HOV lanes are assumed to have a capacity of 1,650 vphpl.

5. V/C= volume-to-capcity ratio. Unacceptable operations occur when the V/C ratio is greater than 1.0.

6. If the Project causes a freeway segment to increase from a V/C ratio<1 to a V/C ratio>1 or contirbutes more than one percent of capacity on a freeweay segment already operating at a V/C ratio>1, then the Project is considered to have an impact.

*These segments are in San Mateo County. The C/CAG Final San Mateo Congestion Management Program-2011 (November,2011), reports the worst roadway segment operation. Mixed-flow and HOV lanes are reported together for CMP freeway segment monitoring for San Mateo County.

Attachment E
